IAA (A-10000 Series) A79-35927 – A79-39974

AERONAUTICAL ENGINEERING

A Continuing Bibliography

Supplement 113

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in August 1979 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA)*

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, at the price code E02 (\$4 75 domestic; \$9 50 foreign)

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971. Since that time, monthly supplements have been issued.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 436 reports, journal articles, and other documents originally announced in August 1979 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements is \$45.00 domestic, \$75.00 foreign. All questions relating to the subscriptions should be referred to NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield Virginia 22161.

TYPICAL CITATION AND ABSTRACT FROM IAA

NASA SPONSORED		AVAILABLE ON MICROFICHE
AIAA ACCESSION NUMBER	A79-10266*#	AUTHORS
TITLE	An experimental study of three-dimensional turbulent boundary layer and turbulence characteristics inside a turbomachinery rotor passage A K Anand and B Lakshminarayana (Pennsylvania State University, University Park, Pa.) (American Society of Mechanical Engineers, Gas Turbine Conference and Products Show, London, England, Apr 9-13, 1978, Paper 78-GT-114) ASME, Transactions, Journal of Engineering for Power, vol 100, Oct 1978, p 676-687, Discussion, p 688-690 19 refs Grant No NGL-39 009-007	AUTHOR'S AFFILIATION
TITLE OF PERIODICAL		PUBLICATION DATE
	Three-dimensional boundary layer and turbulence measurements of flow inside a rotating helical channel of a turbomachinery rotor are described The rotor is a four bladed axial flow inducer operated at large axial pressure gradient The mean velocity profiles, turbulence intensities and shear stresses, and limiting stream-line angles are measured at various radial and chordwise locations, using rotating triaxial hot-wire and conventional probes The radial flows in the rotor channel are found to be higher compared to those at zero or small axial pressure gradient The radial component of turbulence intensity is found to be higher than the streamwise component due to the effect of rotation Flow near the annulus wall is found to be highly complex due to the interaction of the blade boundary layers and the annulus wall resulting in an appreciable radial inward flow and a large defect in the mainstream velocity Increased level of turbulence intensity and shear stresses near the midpassage are also observed near this radial location (Author)	

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 113)

SEPTEMBER 1979

IAA ENTRIES

A79-35927 # Second approximation in theory of a finite-span thin wing in a hypersonic gas flow (Vtoroe priblizhenie v teorii tonkogo kryla konechnogo razmakha, obtekaemogo giperzvukovym potokom gaza) V I Bogatko, A A Grib, and G A Kolton *Leningradskii Universitet, Vestnik, Matematika, Astronomiia*, Jan 1979, p 88-95 8 refs In Russian

The uniform hypersonic flow of an inviscid gas on the windward side of a thin wing of finite span is studied Thin boundary layer theory is applied to obtain corrections to the main Newtonian flow The shock is assumed to be attached to the leading edge at at least two points The special case of a symmetric conical wing with rectilinear leading edge is considered P T H

A79-35928 # Construction of an initial approximation for the solution of the integral equation of a lifting surface (O postroeni nachal'nogo priblizheniia dlia resheniia integral'nogo uravneniia nesushchei poverkhnosti) O F Mel'nikova and N N Poliakhov *Leningradskii Universitet, Vestnik, Matematika, Astronomiia*, Jan 1979, p 104-110 6 refs In Russian

Weissinger's hypothesis is used to obtain in a simple manner an analytic expression for an initial approximation to the solution of the integral equation for a lifting surface It is proved that the approximate solution obtained in this way satisfies the boundary conditions of the problem and the requirement for practical convergence of the iterations P T H

A79-36003 X-ray determination of internal stress states due to surface treatment of TiAl6V4 and TiAl6V6Sn2 (Rontgenografische Ermittlung der bei der Oberflächenbearbeitung von TiAl6V4 und TiAl6V6Sn2 entstehenden Eigenspannungszustände) H E Franz (*Verein Deutscher Ingenieure, Internationale Konferenz über experimentelle Spannungsanalyse, 6th, Munich, West Germany, Sept 18-22, 1978*) *VDI-Berichte*, no 313, 1978, p 453-462 14 refs In German

A report is given on the states of internal stress occurring near the surface on the surface finishing of two titanium alloys (TiAl6V4 and TiAl6V6Sn2) The finishing methods investigated comprise milling, grinding, milling plus grinding, turning, turning plus grinding, rolling and shot peening The results are compared with those relating to steel It is pointed out that taking internal stresses due to finishing into account in aircraft construction may perhaps lead to reductions in weight and thus to lower costs of operation (Author)

A79-36024 Application of advanced data reduction methods to gas turbine dynamic analysis P B Juhl (*Verein Deutscher Ingenieure, Internationale Konferenz über experimentelle Spannungsanalyse, 6th, Munich, West Germany, Sept 18-22, 1978*) *VDI-Berichte*, no 313, 1978, p 637-642

This paper discusses the application of advanced data reduction methods to the evaluation of dynamic data from gas turbines and turbine components The use of the Fast Fourier Transform and of real-time spectrum analyzers is discussed The use of power spectral density and probability density functions for analyzing random data is discussed Examples of the application of these modern techniques to gas turbine testing are presented The use of the computer to automate the data reduction procedures is discussed (Author)

A79-36065 Evaluation of GPS performance for low-cost general aviation A N Joglekar (Mitre Corp, Metrek Div, McLean, Va) In *PLANS 1978, Position Location and Navigation Symposium*, San Diego, Calif, November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc, 1978, p 7-12

This paper presents preliminary results of a simulation effort to evaluate requirements and feasibility of GPS as a civil navigation system The paper focuses on evaluation of GPS requirements, from operational considerations, such as application to nonprecision approaches The conceptual low-cost GPS receiver simulated here does not correct for the ionospheric or tropospheric delay, is sequential in nature, tracks only four satellites, and is not mechanized to make independent range rate measurements based on the Doppler shift of the GPS carrier frequency The proposed GPS system has significantly different performance characteristics from the presently used VOR/DME system The GPS is a low signal level system and may have a relatively slow data rate due to the low cost sequential receiver design The results indicate that although the conceptual low-cost GPS receiver/navigator is potentially more accurate than a VOR, the accuracy may degrade during aircraft turns and satellite shielding periods (Author)

A79-36069 # Internationalization of OMEGA D T Haislip (U.S. Coast Guard, Washington, D C) In *PLANS 1978, Position Location and Navigation Symposium*, San Diego, Calif, November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc, 1978, p 37-39

The OMEGA system of radionavigation is a Very Low Frequency (VLF) system operating in the internationally allocated radio frequency band of 10 to 13 kHz Navigators using the OMEGA system will be able to obtain positional data on a worldwide and nearly continuous basis when the system is in full operation with eight transmitting stations Experimental stations commenced operating in 1966 in support of system evaluation and testing These experimental stations provided coverage over most of the North Atlantic Ocean, North American Continent, and eastern portions of the North Pacific Ocean This coverage provided the fundamental basis for initial operational evaluation and further development of the system intended to be available to the users of all nations, both ships and aircraft This paper will review the growth, current status and future plans for management of this international radionavigation system (Author)

A79-36070 Hyperbolic positioning per se is passe R R Hatch (Magnavox Government and Industrial Electronics Co, Ft Wayne, Ind) In *PLANS 1978, Position Location and Navigation Symposium*, San Diego, Calif, November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc, 1978, p 51-58 7 refs

Hyperbolic navigation schemes, originally instituted to limit computational time, no longer have justification in positioning systems that use microprocessors Instead of differencing raw measurements, the computational process for navigation systems should use raw, biased range measurements The integrated Doppler count in the Transit navigation system is intrinsically hyperbolic, but

results can still be obtained that are optimal in a batch sense. In this paper, a computationally efficient method capable of accounting for the measurement covariance in hyperbolic positioning systems is presented. J M B

A79-36071 Loran C - Its future in the shadow of Navstar GPS J P Van Etten (ITT, ITT Avionics Div., Nutley, N.J.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 63-72 10 refs

The Navstar Global Positioning System, which may become available for civil use in 1990, has a projected development cost of 30 billion dollars. However, U.S. civil users, concentrated in the continental U.S. and its coastal zones, may be better served by the Loran-C long-range regional radio navigation system. Accuracy available to civil users of Navstar is expected to be somewhat poorer than that obtainable from Loran-C; furthermore, Navstar receivers are projected to be twice as costly as Loran-C receivers. J M B

A79-36072 The MX 1105, an integrated Transit/Omega navigator J E Maenpa (Magnavox Government and Industrial Electronics Co., Fort Wayne, Ind.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 73-88 20 refs

An integrated Transit/Omega navigation system based on a single, compact, microprocessor-controlled instrument has been developed. The integrated navigator combines the advantage of highly accurate position fixes in any weather (available through Transit) and the capability of nearly continuous position and velocity sensing over most of the globe (available through Omega). The integrated Transit/Omega system retains the bounded error characteristics and continuous navigation capability of Omega to limit error growth between Transit position fixes. Transit position fix degradation due to Omega-derived velocity is minimized. Testing of the integrated navigator over Atlantic, Pacific and Indian Ocean routes has been carried out. J M B

A79-36077 Reliability, performance, and fault isolation considerations in the design of interconnected navigation systems J S H Liu and T J Murphy (Dynamics Research Corp., Wilmington, Mass.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 114-121 14 refs

The study demonstrates that decentralized approaches in the design of interconnected navigation systems are sometimes better than 'intuitively obvious' centralized approaches suggested by theory. This means that although theory can show that centralized approaches will provide the best navigation accuracy under normal operating conditions, their performance can be adversely affected when conditions are not normal. A good decentralized approach represents an acceptable engineering tradeoff between the issues of accuracy, cost, and reliability. The focus is on interface design for a master-slave hierarchical interconnection. The issues of accuracy, cost, and reliability are developed on the basis of a specific example. It is shown that the design of the decentralized interface is better than that of a centralized interface in terms of an engineering tradeoff between accuracy, cost, and reliability. S D

A79-36082 The results of synthesizing and evaluating potential solutions for Multi-Function Inertial Reference Assembly (MIRA)/ candidate configurations J M Perdzock (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio), R C Burns, and G C Jackson (McDonnell Aircraft Co., St. Louis, Mo.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 159-164

The development of the Multi-Function Inertial Reference Assembly (MIRA) satisfying the combined kinematic data requirements of flight control, navigation, weapon delivery, and terminal area control is reported to be a potential solution to increasing avionics costs on advanced Air Force fighter and transport aircraft of the 1980's. A single line replaceable unit (LRU) of the selected MIRA configuration can replace eight LRUs on the F-15A and is characterized by improvements in velocity and attitude output accuracies while retaining position accuracy, safety and mission reliability, redundancy, maintainability, and survivability. MIRA can accommodate either tuned rotor gyros (TRG) or ring laser gyros (RLG). With performance considerations favoring RLGs and weight projections favoring TRGs, it is found that RLGs are more adaptable for redundancy, afford rapid reaction from cold temperature, exhibit an inherent high dynamic capability, and offer potentially higher reliability and operational life. V T

A79-36084 Drone formation control system (DFCS) - A new generation test range system W A Rice (U.S. Army, White Sands Missile Range, White Sands, N. Mex.) and K D Rehm (IBM Corp., Federal Systems Div., Owego, N.Y.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 182-190

The Drone Formation Control System (DFCS) has been operating at the White Sands Missile Range since September 1976. This paper briefly describes the DFCS and some of the missions performed by it. A brief description of system hardware emphasizes the data link and display subsystems. The DFCS uses distance-measuring equipment to locate a drone, then, the DFCS compares the present drone position to that desired and generates the commands necessary to bring the drone to the desired location. The paper highlights the various types of missions the DFCS can support and discusses missions that used BQM-34s and PQM-102s in single and multiple aircraft formations at all altitudes. Included are manual and automatic control, high 'g' maneuvers, and the takeoff and landing of GF102 and GF86 drones. The effects of multipath on DFCS data link performance over land and water are also presented. (Author)

A79-36086 Evaluation of an FM/CW range measurement system for VTOL landing D G Krenz, D R Colvin (Cubic Corp., San Diego, Calif.), S K Miyashiro, F E Morris, and W A Carlson (U.S. Naval Ocean Systems Center, Tactical Sensors and EW Div., San Diego, Calif.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 298-304

A Precision Ku-Band FM/CW Range Measurement System was designed and built by Cubic for the Naval Ocean Systems Center to test and evaluate its effectiveness as a landing/guidance system for VTOL aircraft. Primary equipment consisted of an interrogator, transponder, control and display console, and government-furnished antennas and computer. The system operated on the principle that a continuous-wave signal modulated onto a radio-frequency carrier and propagated through free space undergoes a phase shift that can be measured to provide slant range. Test results conclusively indicate that the system provides more-than-adequate accuracy for the ranging requirements of a VTOL landing guidance system. (Author)

A79-36087 A navigation filter for an integrated GPS/JTIDS/INS system for a tactical aircraft B A Kriegsmann and W M Stonestreet (Charles Stark Draper Laboratory, Inc., Cambridge, Mass.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 316-320 14 refs Contract No F33657-77-C-0672

An integrated dual-grid navigation system including the Global Positioning System (GPS), the Joint Tactical Information Distribution System (JTIDS), and an Inertial Navigation System (INS) is studied for use in a community of tactical fighter aircraft. A 19-state

minimum-variance filter on board each aircraft is designed to process most efficiently data from the different nav aids. The integration of GPS with a JTIDS/INS system leads to better user overall navigation-system performance by providing more accurate geodetic position and velocity information, better estimates of absolute INS tilts and user clock errors, and more accurate estimation of baro-altimeter bias errors. S D

A79-36090 Stability analysis of relative navigation systems. M S Greenberg (Dynamics Research Corp., Wilmington, Mass.) and H J Rome (Lowell University, Lowell, Mass.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 335-344.

Stability properties of relative navigation systems are investigated with regard to the level of inter-unit range measurement integration within a multi-member airborne community. Each member is capable of processing relative range measurements and inertial dead-reckoning data. The analysis isolates and highlights the effects of various measurement weighting criteria and various measurement selection protocols and demonstrates a crossover from unstable to stable behavior for certain combinations and types of information hierarchies and rel nav filter mechanization choices. A rel nav covariance analysis simulation is used for the evaluation of a four aircraft community, each unit equipped with an inertial dead reckoning system, a TDMA transceiver, and rel nav filter software for the selection, weighting, and processing of inter-unit measurements. (Author)

A79-36096 Recent results in navigation systems utilizing signal aiding from Navstar satellites. J N Damoulakis, V Gylis, and T N Upadhyay (Texas Instruments, Inc., Dallas, Tex.) In PLANS 1978, Position Location and Navigation Symposium, San Diego, Calif., November 6-9, 1978, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1978, p 388-395. 11 refs. Contract No. F04701-75-C-0180.

This paper describes some recent results and experience in designing navigation systems that use signals from GPS/Navstar satellites. Three distinct navigation/system configurations are considered for applications to aircraft, missile, and man-vehicular user systems. The commonality in these three user equipment systems is the continuous use of range/range rate information transmitted from a set of navigation satellites. The basic engineering feature of these systems is their capability to process the range/range-rate measurements. This is done by a real time combination of double-stage piecewise recursive filtering technique of Kalman's type for estimating the user's position and time. This technique consists of fast and slow filter loops. The received measurements are processed at a high rate in the fast loop while using the gains computed by the other loop. The slow loop also processes the system-error covariance matrix and other system statistics. Methods for resolving incompatibilities in the system statistics, resulting from the fast/slow loop processing combination are described. (Author)

A79-36100 Industry seeks lighter aircraft weight. D M North. *Aviation Week and Space Technology*, vol 110, May 21, 1979, p 77, 79, 80, 85.

Future design of small general aviation aircraft will be based on fuel efficiency, safety performance, and reduced maintenance and will be influenced by advances in turbomachinery, composite materials, aerodynamics and avionics, with business and personal aircraft markets expected to grow. Pressurization, anti-icing systems, weather radar and altimeters will be essential features in the 1990's with the use of composite materials for airframe structure, landing gear and propeller blades providing 25% reduction in empty weight. Diesel, rotary and turbine engines will be used noting that turbo charged diesel engines in a four-place aircraft would run at 3500 rpm and would be attached to a composite material propeller by a helicopter type drive shaft. It will cruise at an altitude of 25,000 ft,

with a 1600 mile range, and 26 mile/gal fuel consumption. Wings will have higher aspect ratios, full span flaps with slot-lip roll and flight path spoilers, and pusher propeller technology will be utilized. It is expected that general aviation aircraft will provide about 25% more speed and 50-100% better fuel efficiency than aircraft available now. A T

A79-36122 Profile of a nozzle shaping the free-molecule flow intended to investigate air-intakes and cascades. Iu E Kuznetsov and Ia Sh Flaksman (*Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Sept-Oct 1978, p 171-174.) *Fluid Dynamics*, vol 13, no 5, Mar 1979, p 776-778. Translation.

A79-36248 Directionally solidified blades - Greater strength. C A Lombard (USAF, Materials Laboratory, Wright-Patterson AFB, Ohio). *ManTech Journal*, vol 3, no 3, 1978, p 22-27.

Superalloy turbine blades cast by the directional solidification process have higher stress rupture strength, resistance to thermal fatigue, and greater tensile strength than conventional castings, obtaining longer life and lower maintenance costs. Although blade cost is 1.5 to 2 times that of conventional blades, 300,000 airfoils made by this process are used in JT9D, F100, TF30 and PT6 Pratt and Whitney engines which accumulated more than 1.5 million hours of field use. The three basic directional solidification processes - withdrawal, Rapid Automated Multistation-Directional Solidification, and exothermic are described, noting that the exothermic process was used for the F103, TF-41, T-55 engines, and the TFE731-3 engine which is under NASA contract. Single crystal blades made by an extended directional solidification process are being developed to upgrade engine performance by allowing 125 F higher inlet temperatures, expected to reduce mission cost by 21%, save up to \$7 million in engine development, and increase overhaul life six to seven times. A T

A79-36347 # Lectures on hydroaeromechanics (Lektsii po gidroaeromekhanike). S V Vallander. Leningrad, Izdatel'stvo Leningradskogo Universiteta, 1978. 296 p. 5 refs. In Russian.

The book is a reproduction of Vallander's course on a branch of mechanics dealing with the laws of fluid motion and equilibrium and the laws of interaction between fluids and bodies situated in them. The concept of a fluid comprises both liquids and gases. The lectures deal with such issues as the derivation of the total system of hydrodynamics equations, the formulation of this system of equations for some representative fluid models, and with the fundamentals of hydrodynamics of ideal and viscous fluids. V P

A79-36373 Making fluid flows visible. W Merzkirch (Bochum, Ruhr-Universität, Bochum, West Germany). *American Scientist*, vol 67, May-June 1979, p 330-336. 7 refs.

Two principles of making a fluid flow visible are discussed in this paper. First, the internal edges or boundaries of the primary fluid can be made visible by introducing into it a secondary substance of a different phase. What actually can be seen is the movement of this foreign substance, which is assumed to have the same motion as the primary fluid; this requires that the particles of the foreign substance be as small as possible while still visible. The second principle applies to fluids having optical properties that change while the fluid is flowing. If the relationship between the state of the flow and the change in an optical parameter is known, optical methods could be applied to measure certain properties in the flow field without disturbing the fluid by introducing a measuring probe or a foreign material into it. Since the optical index of refraction of a gas is a function of a gas density, variations in the refractive index can be measured by means of optical interferometry. V T

A79-36374 Boeing 757/767 - On-the-spot report M Hirst *Flight International*, vol 115, May 19, 1979, p 1673-1678

The article reports on Boeing's new airliners, the medium haul 767, seating 221 and the short haul 757 seating 177. The 767's unique seven abreast seating results in a narrower profile, which in conjunction with the large wing area is responsible for the low seat/mile costs claimed by Boeing. The wing design and the decision to use a low tail versus a high tail is also discussed. The 757 is a variation of the 707, 727, 737 theme, and its commonality with the 767 is noted. Many systems, including the auxiliary power supply, the virtually all digital electronics of the avionics system, and the tail section surfaces will be shared. A separate section notes a possible use of a 767-based nose on the 757. The use of a CRT display instead of a mechanical attitude indicator, and the use of a second CRT for horizontal-situation data is detailed. The use of lasers in the inertial reference system (IRS) is also covered, and full specifications, payload and fuel performance data are presented. M E P

A79-36376 Producing light aircraft - Three viability case studies J M Robertson *Aeronautical Journal*, vol 83, Apr 1979, p 135-148 38 refs

The Piper PA-28-140 Cherokee, the Beagle B121 Pup-100, and the Robin HR 200/100 light aircraft production studies are presented comparing their design details, rates of production envisaged and achieved, the attitudes towards light aviation in the U.S., Great Britain and France, the sizes and previous history of the three manufacturers, and the success achieved. The three aircraft dimensions and equipment are described, together with their performance, price and production quantities. The production background of each aircraft is discussed, considering their respective companies' history, the relationship of manufacture to companies' facilities, and the product support that was being offered. Designs of the wings, tail units and fuselage are analyzed, and markets and marketing practices in the countries of origin are considered. Finally, an economic production management plan is outlined. A T

A79-36379 Model verification of force determination for measuring vibratory loads F D Bartlett, Jr (U.S. Army, Structures Laboratory, Hampton, Va.) and W G Flannelly (Kaman Aerospace Corp., Bloomfield, Conn.) *American Helicopter Society, Journal*, vol 24, Apr 1979, p 10-18 11 refs. Army-supported research

The method of force determination for measuring vibratory forces and moments experienced by helicopters is verified by means of laboratory tests of a dynamic helicopter model. The method was used to determine vibratory hub loads on a helicopter with the rotor removed from dynamic calibration data and fuselage accelerometer measurements. The mobility matrix is obtained by direct shaking at the hub and modal acceleration testing in order to calibrate the model. Errors of force determination predictions are found to lie within the accuracy limits of the instrumentation. Results of an application of the force determination method to the flight testing of a UH-1H helicopter fitted with a dynamic antiresonant vibration isolator indicate the potential of force determination for in-flight predictions. A L W

A79-36380 Manufacturers developing fuel-efficient engines J Mayfield *Aviation Week and Space Technology*, vol 110, May 28, 1979, p 46, 47, 49 (3 ff.)

The paper presents an analysis for both the General Electric and Pratt & Whitney fuel-efficient turbofans developed under NASA's Energy Efficient Engine (E3) project. General Electric engine will produce 36,000 lb of thrust and have a bypass ratio of 6.8 during maximum climb power operation. Specific fuel consumption (SFC) of 0.572 is predicted. Pratt & Whitney turbofan will produce 41,000 lb of thrust on takeoff with a bypass ratio of 6.55. Its thrust SFC is predicted as 0.576. The engines use such advanced technologies as active clearance control, single-crystal turbine blades and vanes, new power metallurgy alloys, a 23:1 compressor, new combustor designs and digital electronic engine control systems, and may evolve into prototypes for the commercial transport powerplants of the 1990s. V T

A79-36423 Velocity slip and temperature difference of gas mixtures in quasi-one-dimensional nozzle flows K Nanbu (Tohoku University, Sendai, Japan) *Physics of Fluids*, vol 22, May 1979, p 998, 999

The velocity slip and temperature difference are examined using two-temperature thirteen moment equations. It is shown that the velocity slip becomes maximum just beyond the throat and the temperature difference is appreciable in the supersonic flow regions. (Author)

A79-36484 An optical-fiber multiterminal data system for aircraft J G Farrington and M Chown (Standard Telecommunications Laboratories, Ltd., Harlow, Essex, England) *Fiber and Integrated Optics*, vol 2, no 2, 1979, p 173-193 8 refs. Research supported by the Ministry of Defence (Procurement Executive)

As a result of a study on the potential of optical-fiber multiterminal data systems for avionics, a design approach has been chosen that is expected to be a suitable basis for a wide range of applications. This is a time division multiplexing system, which has features of being highly immune to problems of optical loss and multipath effects in optical highways having redundant paths, and of avoiding the need for any master terminal. This system approach is tailored to characteristics of optical fibers, and should lead to good integrity and ruggedness. A breadboarded model of a terminal has been demonstrated, and the construction of functional models is currently under way. (Author)

A79-36582 # Calculation of a laminar wall jet in a wake (Raschet laminarnoi pritennoi strui v sputnom potoke) V N Zhuravlev *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 31-36 5 refs. In Russian

An integral method is proposed for calculating the fundamental portion of a laminar wall jet propagating in a wake with a longitudinal pressure gradient. It is assumed that the velocity of the jet is greater than that of the wake. V P

A79-36583 # Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas (Ob optimal'nom vybere geometricheskikh kharakteristik povorotnogo kanala malorazmernoi turbiny s povtornym podvodom gaza) I P Goldaev, V V Il'inskiy, and E A Skvorchevskiy *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 37-43. In Russian

The paper deals with gasdynamics methods of profiling channels of auxiliary high-pressure-ratio small-scale aircraft turbines. The influence on the flow of the channel curvature in the radial plane of a small-scale axial-flow turbine is studied. Optimal channel designs for supersonic inlet flows are proposed. V P

A79-36584 # Effectiveness of readmission of the gas in high-pressure-ratio small-scale turbines (Effektivnost' povtornogo podvoda gaza v vysokoperepadnykh malorazmernykh turbinakh) I P Goldaev, V V Il'inskiy, and E A Skvorchevskiy *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 44-48 6 refs. In Russian

A comparative analysis is carried out of the energetic characteristics of a single-blade-ring turbine and a turbine with readmission of the gas. The gasdynamic parameters of the flow in high-pressure-ratio small-scale (auxiliary) aircraft gas turbines are evaluated. V P

A79-36585 # Influence of the flow angle on the characteristics of an elbow-shaped air intake (Vlianie ugla natekaniya potoka na kharakteristiki kolenoobraznogo vozdukhoozabornika) A D Griga and N M Zubov *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 48-50. In Russian

It is shown experimentally that an increase in inlet blade angle from 75 to 105 degrees leads to an increase in circumferential nonuniformity and a decrease in radial nonuniformity, whereas the total pressure losses are hardly affected. A satisfactory flow structure at the air-intake exit can be obtained by proper selection of the geometrical relations. V P

A79-36586 # Allowing for the wall boundary layer in an axial compressor stage (K voprosu ucheta pristenochnogo pogranichnogo sloia v stupeni oseвого kompressora) N S Berestneva, V A Koval', F G Kontsevich, and Iu G Otsechkin *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 51-54. In Russian

If an axial compressor blade is designed without allowance for the boundary layer in the flow area, the flow past the end sections is characterized by large positive angles of attack. This leads to an increase in boundary layer thickness at the blade back and possible boundary layer separation. In the present paper, a method of designing compressor blades with allowance for the boundary layer is proposed, and test data obtained with blades designed by this method are examined. V P

A79-36587 # Formation of water-fuel emulsions in tanks of grounded aircraft (K voprosu obrazovaniia vodno-toplivnykh emul'sii v samoletnykh bakakh v nazemnykh usloviakh) V T Vasilenko and A S Rasborshchuk *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 54-56. In Russian

The factors and conditions leading to the formation of water fuel emulsions in aircraft tanks after refueling are examined. The conditions for the formation of emulsion water depend on the temperatures and concentrations of moisture both in the remaining and added fuel and on the stability of water-fuel emulsions. A nomogram for determining the mean temperature and mean water content in the fuel mixture after refueling is proposed. V P

A79-36588 # Informativeness and effectiveness of digital command-generating devices (Informativnost' i effektivnost' diskretnykh komandnykh priborov) N I Brekhin *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 57-61. In Russian

The speed of operation of modern onboard computers exceeds considerably that of analog command-generating devices. It is shown that the resulting impairments of device capacity and information transfer can be eliminated by using properly designed digital command-generating devices. V P

A79-36589 # Some possible applications of identification theory techniques in telemetry (O nekotorykh napravleniakh primeneniia metodov teorii identifikatsii v telemekhanike) Iu N Sokolov, N M Podareva, and V I Uspalenko *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 61-70. 24 refs. In Russian

The basic principles of model representation of telemetry processes and the application of identification theory techniques to information problems are reviewed. Some aspects of the application of information theory techniques to the solution of problems of recording and analyzing telemetry data on the state of flight vehicles are discussed. V P

A79-36592 # Differential method of designing rational aircraft frames made of composite materials (Differentsial'nyi metod proektirovaniia ratsional'nykh korpusnykh aviakonstruktsii iz kompozitsionnykh materialov) V E Gaidachuk and Ia S Karpov *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 81-92. 6 refs. In Russian

In the present paper, some rational structure diagrams for composite subsonic aircraft frames and fuselages are analyzed, and the advantages which accrue from the use of composite materials are pointed out. A structure diagram with distinctly separated functions

of the principal load carrying members is proposed and its effectiveness is evaluated. V P

A79-36593 # Formulation of empirical formulas for calculating the hydraulic resistance of networks (Opredeleniie vida empiricheskikh formul dlia rascheta gidraulicheskikh soprotivlenii v seti) N V Okolota, N A Skliarenko, N A Shelomov, and B D Ialovkin *Samoletostroenie - Tekhnika Vozdushnogo Flota*, no 43, 1978, p 94-98. In Russian

Okolota et al (1976) have analyzed straight and curved networks of deicing systems and have formulated empirical formulas for calculating hydraulic resistances required for designing aircraft deicing and air-conditioning systems. In the present paper, a method is proposed for deriving empirical formulas for calculating the hydraulic resistance of any desired portion of a deicing network. V P

A79-36644 The British Aerospace Harrier Case study in aircraft design J W Fozard (British Aerospace, Aircraft Group, Kingston-upon-Thames, Surrey, England) New York, American Institute of Aeronautics and Astronautics, Inc., 1978. 190 p. 100 refs.

This work covers the history of the development of the jet V/STOL Harrier aircraft. Fairly detailed information on the main engineering concepts of the aircraft are given, including the inlet, the Pegasus vectored thrust engine, nozzle bearing assemblies, engine installation, engine controls and cockpit throttle box, fuel system and its installation, air intake aerodynamic design, nozzle actuation system, wing aerodynamic design, stability and control qualities, flight control system, structural design, undercarriage design, and cockpit and escape system. Attention is also given to the operational aspects of the aircraft on land and on ships. P T H

A79-36645 # The Rockwell International Sabreliner-65 Case study in aircraft design G E Mathwig (Rockwell International Corp., St. Louis, Mo.) New York, American Institute of Aeronautics and Astronautics, Inc., 1978. 80 p.

The report summarizes the design and development process for the Sabreliner-65 executive jet aircraft, including the marketing and financial studies. The process was an experience in codevelopment involving several companies. The development schedule, test objectives and results, and design problems and solutions are summarized. Tables and graphs are given which summarize model study parameters, engines considered, study performance data, aircraft configuration, and basic aerodynamic characteristics. P T H

A79-36646 # The Lockheed C-5 Case study in aircraft design W C J Garrard (Lockheed-Georgia Co., Marietta, Ga.) New York, American Institute of Aeronautics and Astronautics, Inc., 1978. 68 p.

The paper reports on the activities during each of the four main phases in the design of the C-5 transport: (1) preconcept formulation phase, (2) concept formulation phase, (3) project definition phase and proposal, and (4) acquisition phase with detailed design, manufacture, and qualification. The initial requirements, configuration studies, airframe design studies, trade-off studies, engine and landing gear selection, cargo configurations, reliability and maintenance requirements, flying qualities and augmentation considerations, structural tests, and flight tests are summarized. P T H

A79-36702 Bonding and durability A C Fehrle and R L McDougal (Lockheed-Georgia Co., Marietta, Ga.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790561*. 14 p.

Bonding materials and processes and the increasing use of the adhesive bonded structures in all Lockheed cargo aircraft starting with the C-130 are evaluated. By analyzing the application of bonding to structural durability, it is shown that more durable airframe structures can be built at little or no weight penalty while meeting the durability and damage tolerance criteria imposed by the

new Military Standards and Specifications. An experiment conducted under NASA contract has shown that it may be economically feasible to use laminated sheet structures or bonded reinforcements throughout the aircraft, however, it may not only be feasible but mandatory in fatigue and fracture critical areas of future aircraft. Further improvements can be achieved by combined advantages of laminated structures and cold working or interference-fit fasteners as well as by the use of the new generation adhesives and surface preparations. V T

A79-36704 **Adhesive bonded structure of new pressurized piston twin aircraft** A Nagao, T Nakao, and K Usuki (Fuji Heavy Industries, Ltd., Tokyo, Japan) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790563* 7 p

Adhesively bonded structures, that is, metal to metal bonding of cabin and wing skin and honeycomb sandwich panel of pressure bulkhead, are used in newly developed general aviation pressurized piston twin aircraft, Rockwell/Fuji Model 700. This paper presents the design consideration of each bonded structure showing the advantages of bonding, and its quality control procedure used in subject aircraft. (Author)

A79-36705 **Effects of a spin chute installation on spin characteristics** J D Patrick (Piper Aircraft Corp., Lock Haven, Pa.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790564* 3 p

Data extracted from certification spin testing on a light general aviation training airplane was examined for differences in recovery characteristics that could be assigned to the spin chute installation. Several center of gravity and rudder surface positions were tested. Both normal spins and spins with aileron misuse were evaluated. (Author)

A79-36706 * **Spin flight research summary** J M Patton, Jr., H P Stough, III, and D J Dicarlo (NASA, Langley Research Center, Hampton, Va.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790565* 11 p 8 refs

An extensive general aviation stall/spin research program is underway at the NASA Langley Research Center. Flight tests have examined the effects of tail design, wing leading edge design, mass distribution, and minor airframe modifications on spin and recovery characteristics. Results and observations on test techniques are presented for the first airplane in the program. Configuration changes produced spins varying from easily recoverable slow, steep spins to unrecoverable, fast flat spins. (Author)

A79-36707 **Conversion of wing surface pressures into normalized lift coefficient** A W Hoadley (Western Michigan University, Kalamazoo, Mich.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790567* 10 p

A normalized lift coefficient indicator has been developed for single-engine aircraft. The system developed incorporates a low-cost capacitance type pressure transducer and an electronic circuit to calculate the wing pressure coefficient. The system eliminates the need for probes protruding from the aircraft's wing by using two flush pressure taps on the wing surface and the aircraft's static pressures. The pressure taps have been located so as to produce a normalized lift coefficient display that is nearly linear, independent of flap setting, and independent of thrust. The system gives the aircraft's proximity to a stall condition regardless of its load factor, weight, or configuration. The preceding should reduce the fatal stall/spin accidents that are one of the foremost killers in general aviation. (Author)

A79-36708 **The effects of low-level wind shear on the approach and go-around performance of a landing jet aircraft** R A Greene (Safe Flight Instrument Corp., White Plains, N Y.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790568* 9 p 14 refs

The development and operation of the Wind Shear Monitor System which computes the thrust required to overcome horizontal wind shears and vertical downdrafts during jet landing is outlined. The operation of the Wind Shear Computer which resolves the two orthogonal vectors of a wind shear encounter and provides meter output and threshold alert indications of the encounter are described. Severe wind shear occurs when the additional thrust required to maintain desired glide path and airspeed exceed 15% of the aircraft's gross weight. A 3-axis wind model has been developed for a Boeing 747 training simulator to repeat weather conditions at the time of an accident. Beyond signaling for the crew a severe reduction in performance, indication of positive shear conditions acts to guide the crew to anticipate a negative shear, thus preventing a reduction of thrust. The early rapid detection of a severe encounter will significantly improve the go-around profile and recovery opportunities. A T

A79-36709 * **A Demonstration Advanced Avionics System for general aviation** D G Denery, G P Callas, C T Jackson, B K Berkstresser, and G H Hardy (NASA, Ames Research Center, Moffett Field, Calif.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790569* 11 p

A program initiated within NASA has emphasized the use of a data bus, microprocessors, electronic displays and data entry devices for general aviation. A Demonstration Advanced Avionics System (DAAS) capable of evaluating critical and promising elements of an integrating system that will perform the functions of (1) automated guidance and navigation, (2) flight planning, (3) weight and balance performance computations, (4) monitoring and warning, and (5) storage of normal and emergency check lists and operational limitations is described. Consideration is given to two major parts of the DAAS instrument panel: the integrated data control center and an electronic horizontal situation indicator, and to the system architecture. The system is to be installed in the Ames Research Center's Cessna 402B in the latter part of 1980; engineering flight testing will begin in the first part of 1981. V T

A79-36710 **Electronic system safety - Testing reality** G L Neal (Collins Radio Group, Collins Avionics Div., Cedar Rapids, Iowa) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790570* 7 p

Fundamentals of redundant avionics systems architecture are discussed, exposing some of the difficult and least understood redundancy defeating mechanisms. Such basic definitions as single, dual and triple concepts and the mean time between failures are given showing that simplistic thinking tends to give unreliable results because of the usually ignored problems of rare faults, common faults, tolerance propagation, hidden faults, unmonitored monitors, inoperative reconfiguration switches, and expediency of installation. In order to achieve the reasonable low mission failure rates it is noted that at least dual and sometimes triple avionics are required. V T

A79-36711 **The design and selection of optimum propellers for general aviation aircraft** H V Borst (Henry V Borst and Associates, Wayne, Pa.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790575* 15 p 11 refs

Using the latest available methods and data for designing propeller blades and determining performance, a study of the general aviation propellers installations is given. In this study four general aviation aircraft are considered covering the range of speed and power encountered in this field. Propellers typical of those currently

being used are considered and their performance is calculated and compared with the ideal to find the efficiency improvements that might be possible. A study for the aircraft considered showed that new propellers can be designed that will have improved performance that approaches that of the ideal or optimum. The use of the new computer generated airfoils was also considered in the design of new propellers with promising results (Author)

A79-36712 * **The analysis of propellers including interaction effects** B W McCormick, A S Aljabri, S J Jumper, and Z N Martinovic (Pennsylvania State University, University Park, Pa) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790576* 14 p 11 refs Grant No. NSG 1308

Analytical and experimental studies have been undertaken on propellers operating in the unsteady flow field produced by interaction effects due to the fuselage, wing, and nacelles. Methods have been developed and verified experimentally for determining the velocity field in which a propeller operates as well as its aerodynamic and dynamic response to this unsteady environment. Methods are presented for predicting the net thrust of a propeller wing-body combination as well as the unsteady thrust and torque acting on the propeller. Sample calculations as well as wind tunnel and flight test results are presented which illustrate the sensitivity of a propeller to flow field in which it is operating (Author)

A79-36713 **Composite applications at Bell Helicopter** U K McCaskill, Jr (Bell Helicopter Textron, Fort Worth, Tex.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790578* 13 p

The past, present and future usage of fiber reinforced plastics in Bell helicopters is presented. In 1953 fiberglass composites were used in cabin structural areas of the 47H-1 which is still in active service. Current production helicopters use composites as a facing material, sandwich panels, nose doors, fairings, passenger steps, and the cabin shell. In helicopters being developed, fiberglass main rotor blades are expected to achieve retirement life after more than 10,000 hours due to gradual failure modes, elimination of corrosion and improved fatigue life. Blade manufacturing methods and certification tests are described. Other developmental applications are in control tubes of filament wound graphite epoxy and injection molded nylon/fiberglass fittings producing 20% weight saving, bellcranks with 30% weight saving and cost reduction of 50%, boost cylinders for 3000 psi and 270 F service, and engine cowlings and fairings with fire resistance. Other applications such as vertical fins, landing gear skid tubes, floats, horizontal stabilizers and taildoor driveshafts are discussed. A flight evaluation program conducted under a NASA contract to obtain information on the durability of advanced composite components in field service is described. A T

A79-36714 **Development of an aircraft composite propeller** W B Harlamert and R Edinger (Hartzell Propeller, Inc., Piqua, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790579* 7 p

The current aircraft noise regulations effected the design of propellers where tip speeds were reduced to meet these regulations. Reduced tip speeds were accomplished by reducing propeller rpm and/or propeller diameter. To retain propeller performance, diameters were increased, or the number of blades increased, respectively. These changes effected the propeller weight drastically. A composite propeller blade has been developed that is significantly lighter than a blade fabricated from aluminum. Additional advantages of the composite blade is strength and maintenance characteristics. Considerable testing was accomplished to demonstrate the strength and fatigue characteristics of the blade (Author)

A79-36715 **Design description of a four-place business jet using two WR-19 engines** J Roskam (Kansas, University, Lawrence, Kan) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790580* 11 p

This paper describes the design of an advanced, four-place business jet airplane around two Williams-Research WR 19 engines. In addition to the general layout, the performance, weight and balance characteristics of the airplane are described and illustrated by graphical examples. A detailed comparison in terms of fuel-used is made with the Learjet M35, the Cessna Citation I, the Foxjet and several other general aviation twins. It is shown that the airplane described offers substantial advantages in terms of fuel economy over all these airplanes (Author)

A79-36716 **The Learjet 'Longhorn' series - The first jets with winglets** P T Reynolds (Gates Learjet Corp., Wichita, Kan) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790581* 7 p

The Gates Learjet model 28/29 configuration with winglets offers performance increases over Model 25 which has similar configuration except for the wing, both during cruise and takeoff and landing. Cruise fuel flows are up to 26% lower than Model 25 for the same payload/speed combination. Such effects as an increase in aspect ratio, an end plate effect and a forward component of the winglet aerodynamic force are discussed, noting NASA's pioneering work in the field. Consideration is also given to some details of stability and control and it is noted that Model 28/29 is certified for operations up to 51,000 feet. Models 54/55/56 incorporating the same wing/winglet concept and utilizing high bypass turbofan engines and featuring a larger fuselage are currently under development, with the first flight expected early in 1979. V T

A79-36717 **Improving business jet performance - The Mark Five Sabreliner** L M Timmons (Raisbeck Group, Seattle, Wash) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790582* 17 p 5 refs

By applying a unique combination of theoretical analysis, flight test development and advanced FAA certification methods, the Raisbeck Mark Five Sabreliner became a reality. This configuration with advanced aerodynamics, systems and structure has been incorporated on both existing and new production versions of the aircraft. It offers a minimum of 25% range increase while maintaining or reducing takeoff and landing field lengths. The development approach used for the Mark Five system is detailed, including the rationale for each of the improvements incorporated. FAA certification plan procedures used on this program are discussed. Performance improvements realized in actual operation of the Mark Five system are also detailed to demonstrate the advantages from a customer's viewpoint (Author)

A79-36718 **A general aviation flight test application of the on-board computer** P R Leckman (Rockwell International Corp., Bethany, Okla) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790583* 7 p

The Digital Data Acquisition System (DDAS) which includes minicomputers both in on-board and in ground-based equipment has been used in flight test programs. Functions performed are monitor critical parameters, alert to exceed limits, engine cooling development, cruise performance, climb performance, stall speed, stress surveys, engine detonation survey, and weight and center gravity. Operating procedures and implementation problems are discussed and it is concluded that using a DDAS will reduce the post flight data analysis man-hours, but requires more thorough preparation prior to flight testing. As computers become more compact and available at reduced costs, their more widespread use in the flight test programs of general aviation aircraft manufacturers is expected. V T

A79-36719 * **Design of quiet efficient propellers** G P Succì (MIT, Cambridge, Mass) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790584* 15 p 13 refs Research sponsored by the U S Environmental Protection Agency, Contract No NAS1-15154

A numerical computation scheme has been developed to determine the sound generated by propellers. A comparison of these calculations to the noise data taken in the flight test of a propeller driven aircraft shows good agreement. The method is then applied in a parametric study of fixed pitch propellers designed to reduce noise. All these techniques reduce noise while maintaining shaft speed so that the method presented here may be used in a retrofit option for the general aviation fleet (Author)

A79-36720 **Practical design of minimum induced loss propellers** E E Larrabee (MIT, Cambridge, Mass) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790585* 11 p 7 refs

An efficient procedure, which may be adapted to pocket calculators, has been developed to determine the geometry of minimum induced loss propellers matched to a specified operating point characterized by disc loading, advance ratio, and number of blades. Consistent procedures are described to account for the effects of arbitrary geometry, off design point operation, and propeller-body interaction (Author)

A79-36721 **Crashworthiness analysis of field investigation of business aircraft accidents** R G Snyder and T J Armstrong (Michigan, University, Ann Arbor, Mich) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790587* 15 p 17 refs Research supported by the University of Michigan

During the period 1964-1977 some 7,351 aircraft engaged in business flying, and 883 in corporate/executive operations, were involved in accidents reported by the NTSB. These accidents were reviewed utilizing the University of Michigan Computerized Accident Files to provide an overall view of the incidence and nature of business/executive aircraft accidents relative to occupant crash injuries. In addition more detailed case studies of selected accidents investigated including a Lear Jet 25B, Cessna 421, Beech Volpar Model 18, and Ted Smith Aerostar 601, are provided to illustrate specific types of crashworthiness, occupant protection, or post-crash emergency egress findings applicable to business/executive operations. Post-crash fire was reported in 29 cases (16.3%) during the 3-year period (1975-1977). Emergency egress problems involving smoke and fire are discussed. Data from 1975-1977 indicate that the chances of being fatally injured in an accident is significantly greater than receiving serious injury, suggesting a lack of crashworthy performance which may be predicted to improve as more accidents occur in which crew shoulder harnesses are installed and worn (Author)

A79-36722 * **Nonlinear structural crash dynamics analyses** R J Hayduk, R G Thomson (NASA, Langley Research Center, Hampton, Va), G Wittlin (Lockheed-California Co, Burbank, Calif), and M P Kamat (Virginia Polytechnic Institute and State University, Blacksburg, Va) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790588* 14 p 12 refs

Presented in this paper are the results of three nonlinear computer programs, KRASH, ACTION and DYCAST used to analyze the dynamic response of a twin-engine, low-wing airplane section subjected to a 8.38 m/s (27.5 ft/s) vertical impact velocity crash condition. This impact condition simulates the vertical sink rate in a shallow aircraft landing or takeoff accident. The three distinct analysis techniques for nonlinear dynamic response of aircraft structures are briefly examined and compared versus each other and the experimental data. The report contains brief descriptions

of the three computer programs, the respective aircraft section mathematical models, pertinent data from the experimental test performed at NASA Langley, and a comparison of the analyses versus test results. Cost and accuracy comparisons between the three analyses are made to illustrate the possible uses of the different nonlinear programs and their future potential (Author)

A79-36723 **Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics** G Wittlin (Lockheed-California Co, Burbank, Calif), D J Ahrens, and A W Bloedel (Cessna Aircraft Co, Wichita, Kan) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790589* 14 p 8 refs U S Department of Transportation Contract No FA75WA-3707

The results of four fully instrumented, full-scale crash tests involving a single-engine, high wing light airplane are described herein. The tests were performed under a contract sponsored by the Federal Aviation Administration. The range of impact conditions included initial airplane roll and/or yaw, a nose-down attitude, a flared nose-up attitude and impacts onto a rigid (concrete) and a flexible (soil) surface. Photographs are presented showing the impact conditions, as well as some typical postcrash damage. The crash test models, analyzed using digital computer program KRASH, are described. Typical analysis versus test correlation results as well as a summary correlation for all four crash tests are presented. The application of Program KRASH to assess structural design concepts with regard to crash dynamics characteristics is briefly described (Author)

A79-36724 **Seat/occupant crash dynamic analysis verification test program** R F Chandler (FAA, Civil Aeromedical Institute, Oklahoma City, Okla) and D H Laananen (Pennsylvania State University, University Park, Pa) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790590* 98 p 26 refs

The Federal Aviation Administration is developing a computer modeling program (SOMLA/Seat Occupant Model Light Aircraft) in an attempt to provide a practical engineering and design analysis tool for aircraft seat designers. To validate the model, two series of well-instrumented controlled tests have been completed by the FAA Civil Aeromedical Institute. These tests used two basic seat configurations, two different impact vector orientations, and two different impact levels to produce both elastic and plastic seat deformations. Measurements of seat reaction loads, seatbelt loads, and dummy accelerations were made, and the tests were documented by high-speed motion picture film. Each test condition was repeated to obtain a statistical measure of test variability. The results of these tests, and their implications regarding the development of the model, are presented (Author)

A79-36725 * **NASA general aviation crashworthiness seat development** E L Fasanella (Vought Corp, Hampton, Va) and E Alfaro-Bou (NASA, Langley Research Center, Hampton, Va) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan, Apr 3-6, 1979, Paper 790591* 13 p 15 refs

Three load limiting seat concepts for general aviation aircraft designed to lower the deceleration of the occupant in the event of a crash were sled tested and evaluated with reference to a standard seat. Dummy pelvis accelerations were reduced up to 50 percent with one of the concepts. Computer program MSOMLA (Modified Seat Occupant Model for Light Aircraft) was used to simulate the behavior of a dummy passenger in a NASA full-scale crash test of a twin engine light aircraft. A computer graphics package MANPLOT was developed to pictorially represent the occupant and seat motion (Author)

A79-36726 Crash-resistant fuel systems for general aviation aircraft. W T Edwards (FAA, National Aviation Facilities Experimental Center, Atlantic City, N.J.) and W M Perrella, Jr (FAA, Seattle, Wash.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790592* 13 p 6 refs

A significant percentage of general aviation aircraft accidents result in postcrash fires due to the ignition of spilled fuel. This condition often causes further injury or even death to the occupants. Testing was undertaken to examine the performance of light weight, flexible, crash-resistant fuel cells with frangible fuel line couplings. Included in the experiments were four full-scale crash tests of a typical light twin-engine aircraft. In three of these tests, the crash-resistant fuel system performed satisfactorily. However, the fourth test, which used the lightest weight tanks, resulted in tank failures which indicated a possible lower strength limit to the tank material. (Author)

A79-36727 The impact of noise regulations on propeller design. D G M Davis (Dowty Rotol, Ltd., Gloucester, Essex, England) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790593* 11 p

Propeller noise is largely dependent upon tip speed and a reduction of this inevitably leads to either performance or weight penalty. A new aerofoil section has been developed which permits blade loading to be increased. Thus, slower revving propellers can be designed without degrading the performance or imposing a weight penalty. The paper introduces the characteristic differences in performance of the new section with more conventional ones and looks at the design of a range of propellers to illustrate the trade between noise, performance and weight with each type. (Author)

A79-36728 Propeller aircraft noise around general aviation airports. F W J van Deventer (Delft, Technische Hogeschool, Delft, Netherlands) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790594* 15 p 7 refs

In recent years systematic flyover noise measurements of propeller driven general aviation airplanes were performed. This paper presents a brief description of the measurement and data reduction techniques together with some results. Computation methods are given to estimate the effect of powersetting on the noise level and to approximate the shape of the noise field around these aircraft. They are used to compute Leq-contours around general aviation airports. Contour plots are used to compare the relative effects of several measures for noise reduction on the ground. Noise reduction at the source is the most effective way to achieve this goal. (Author)

A79-36729 * Preliminary QCGAT program test results. R W Koenig and G K Sievers (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790596* 11 p

The paper presents the NASA Lewis program to demonstrate that large engine technology can be applied to general aviation engines to reduce noise, emissions, and fuel consumption. After a Phase I study, two contractors, Garrett AiResearch and AVCO-Lycoming, were selected to design, manufacture, assemble, test, and deliver their Quiet, Clean, General Aviation Turbofan (QCGAT) engines to NASA. Noise, emission, and performance goals and how well they were met are discussed. Noise goals involve take off noise 35 n mi from runway threshold, sideline noise at 25 n mi and approach noise 1 n mi from the runway at an altitude of 370 ft. The AiResearch engines power a stretched Learjet 35 and the Lycoming a specially conceived Beech executive jet, resulting in differing power goals. Thus the thrust goal for the Lycoming was 1622 lb while the AiResearch goal was 3937 lb. Cruise thrust goals were 485 lb at

Mach 0.6 at 25,000 ft and 903 lb at Mach 0.8 at 40,000 ft respectively. The design of both engines, based on existing cores, is studied, noting such special QCGAT features as new reduction gears, combustor and power turbine. Test results are given, indicating that while the goals for noise and thrust were met those for emissions were only partially met. M E P

A79-36730 Proper aircraft tire size selection - Optimum performance with minimum maintenance. L J Gehrett (Goodyear Tire and Rubber Co., Akron, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790598* 7 p

A79-36731 Advanced braking controls for business aircraft. D M Longyear and E. A. Hirzel (Crane Co., Hydro-Aire Div., Burbank, Calif.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790599* 14 p

Automatic braking capability is essential if a business aircraft is to compete with commercial ones in a Microwave Landing System (MLS) environment. The principles involved in braking an aircraft are discussed and it is concluded that an essential feature required to assure optimum performance of the braking system is the skid control or antiskid system. Consideration is given to some details of the brake/tire/runway theory, particularly to the tire friction phenomena. It is suggested for business aircraft that their skid control system should be coupled to such equipment as autobrakes and autoflaps which will increase the number of possible landing sights, and more importantly, will improve the pilot's safety margins. V T

A79-36732 Aircon electrically heated acrylic. W Rothe (PPG Industries, Inc., Huntsville, Ala.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790600* 5 p

A system for preventing the formation of ice on plastic aircraft transparencies by application of electric heat is described, and performance data for the system are presented. The system is based on resistance wire technology in use with glass laminates. It can be operated from any available voltage system, ac or dc, and is adaptable to a wide variety of aircraft. Positive static drain is provided to reduce the effect of static discharge of aircraft instruments and prevent damage to the heating system. C K D

A79-36734 Canadair Challenger flight test status. R D Neal (Canadair, Ltd., Montreal, Canada) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790602* 7 p

The initial flight of the Canadair Challenger, an all new aircraft designed for the business jet market of the 1980s and 1990s, occurred two years after program go-ahead and 21 months after release of the first engineering drawings. Three preproduction aircraft are assigned to the flight test program in Montreal and then at Mojave, California. As part of the regular flight development effort, as well as assurance that a safe flight to Mojave could be accomplished, the general handling qualities and single-engine performance were evaluated in the Montreal test program. The tasks identified for the Mojave test program included change of engine from 6700 lb to 7500 lb production engines, change of horizontal tail to production elevator configuration, installation of flight flutter vane system, complete ground vibration test, complete instrumentation and calibration. The 5:1 by-pass ratio turbofan engine tested prior to the installation provides the lowest specific fuel consumption of any turbine engine now used on a business jet aircraft. V T.

A79-36735 A new light twin using bonded metal construction. B McCullough and L. W. Bingham, Jr (Gulfstream American Corp., Savannah, Ga.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790603* 15 p

This paper describes the design and certification program for a new light twin-engine aircraft. The factors considered in the design of the aircraft, the flight testing, and the changes required for certification are described. Some of the problems encountered in flight testing, and the solutions to these problems, are also discussed. (Author)

A79-36736 * Some theoretical considerations of a stall proof airplane. H L Chevalier (Texas A&M University, College Station, Tex.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790604* 15 p. Grant No. NsG-1407

For the stall proof airplane there should be a stabilizing pitching moment below the stall angle of attack of sufficient amount to prevent the attainment of the stall angle of attack which cannot be over-ridden by control deflections. This paper presents (1) a development of the moment equations to show the theoretical considerations of a stall proof airplane and (2) the nonlinear moment characteristics that must be obtained to satisfy the stall proof requirements. In addition, it is shown that an aerodynamic spoiler located on the under surface of the horizontal tail can be designed to meet these requirements of a stall proof airplane. Wind tunnel results are shown to validate assumptions and predictions. (Author)

A79-36737 * Concepts for reducing exhaust emissions and fuel consumption of the aircraft piston engine. B J Rezy, K J Stuckas, J R Tucker, and J E Meyers (Teledyne Continental Motors, Mobile, Ala.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790605* 35 p. 23 refs. Research supported by the Teledyne Continental Motors, Contract No. NAS3-19755

A study was made to reduce exhaust emissions and fuel consumption of a general aviation aircraft piston engine by applying known technology. Fourteen promising concepts such as stratified charge combustion chambers, cooling cylinder head improvements, and ignition system changes were evaluated for emission reduction and cost effectiveness. A combination of three concepts, improved fuel injection system, improved cylinder head with exhaust port liners and exhaust air injection was projected as the most cost effective and safe means of meeting the EPA standards for CO, HC and NO. The fuel economy improvement of 4.6% over a typical single engine aircraft flight profile does not though justify the added cost of the three concepts, and significant reductions in fuel consumption must be applied to the cruise mode where most of the fuel is used. The use of exhaust air injection in combination with exhaust port liners reduces exhaust valve stem temperatures which can result in longer valve guide life. The use of exhaust port liners alone can reduce engine cooling air requirements by 11% which is the equivalent of a 1.5% increase in propulsive power. The EPA standards for CO, HC and NO can be met in the IO-520 engine using air injection alone or the Simmonds improved fuel injection system. (Author)

A79-36738 Dual breakerless aircraft magneto. R S Cerny and J J Wycallis (Bendix Corp., Engine Products Div., Sidney, N.Y.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790606* 6 p.

Advantages of the dual breakerless aircraft magneto are presented. The system eliminates mechanical switching and actuation, thus preventing wear induced timing shift and degraded performance inherent in conventional magnetos. The operation of both the conventional and the breakerless systems is detailed, showing that the latter provides more consistent performance while eliminating the regular maintenance required by the former. A starting aid which has been developed to complement the breakerless magneto is also discussed. (MEP)

A79-36739 Selection of aircraft turbocharger systems. N Richardson (Garrett Corp., Aircraft Research Industrial Div., Los Angeles,

Calif.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790608* 11 p.

Selection of turbochargers and control systems is aided by analytical predictions of system performance and by comparisons of flight test data to the prediction model. Consideration is given to the turbocharger design optimization, while a design tailored to a specific application is possible, it is customary to choose the best components from a selection already available. Different control systems are evaluated and it is noted that the locations of the various operating limits in the control system operating ranges vary, depending on the desired manifold pressures and engine speeds, and the compressor and turbine used. Steady state mass flow continuity through the turbo/control and engine system, and power balance between the turbocharger compressor and turbine are considered as the main physical principles on which performance calculation are based, and a performance prediction calculation flow chart is presented. The inconsistencies between flight test data and predicted performance can be a basis for correcting the analytical model of the engine and turbo/control system. (VT)

A79-36740 * Determination of cooling air mass flow for a horizontally-opposed aircraft engine installation. S J Miley, E J Cross, Jr., N A Ghomi, and P D Bridges (Mississippi State University, State College, Miss.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790609* 11 p. 5 refs. Grant No. NsG 1083

The relationship between the amount of cooling air flow and the corresponding flow pressure difference across an aircraft engine was investigated in flight and on the ground. The flight test results were consistent with theory, but indicated a significant installation leakage problem. A ground test blower system was used to identify and reduce the leakage. The correlation between ground test cell determined engine orifice characteristics and flight measurements showed good agreement if the engine pressure difference was based on total pressure rather than static pressure. (Author)

A79-36741 Fretting fatigue, with reference to aircraft structures. J A Alic and A Kantimathi (Wichita State University, Wichita, Kan.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790612* 15 p. 43 refs. Grant No. AF-AFOSR-77-3422

Present knowledge concerning the mechanisms of fretting fatigue is reviewed, with particular attention to the following factors: stresses at and near the contacting surfaces, location of crack initiation sites with respect to regions of highest surface stress and the slip-nonslip boundary, contributions of surface damage to crack initiation, propagation of microcracks initiated by fretting, the effects of mean stress, and fretting fatigue under variable amplitude loading. In the experimental program, a specially constructed apparatus was used to simulate conditions at the faying surface in a structural joint. Fretting fatigue tests were carried out on 7075-T7351 aluminum alloy using stress ratios of +0.2, +0.5, and -0.2. (Author)

A79-36742 New technologies for general aviation aircraft. K H Bergey (Oklahoma, University, Norman, Okla.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790613* 18 p. 16 refs. FAA-supported research.

An assessment of new technologies for use in general aviation aircraft is covered. The study presents 46 new or underused technologies including Wankel engines, crushed honeycomb sandwich panels, crash resistant fuel cells, that could be incorporated in general aviation aircraft with benefit to safety, performance, utility, and cost. Social and political trends, such as statutory highway speed limits, and the need for improved fuel efficiency, as much as the technologies themselves, will affect the rate at which these technologies can be integrated into the fleet. Four proposals of aircraft are given which could capitalize on some of the trends the report considers significant to general aviation. The four consist of a high

speed single engine aircraft, a single engine turboprop five seater, a single engine crashworthy aircraft, and a twin engine ducted propulsor commuter/cargo aircraft
M E P

A79-36743 General aviation aircraft design for performance using small computers J C Narramore (Cessna Aircraft Co., Wichita, Kan.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790614* 7 p 8 refs

A computerized preliminary design system for reciprocating engine aircraft has been developed which is applicable to a desk top mini-computer. This system integrates several performance, aerodynamics, and structural weight estimation routines into a procedure capable of investigating a wide variety of aircraft design problems. After the conceptual configuration and performance requirements are established, the mini-computer design system can be used to determine the aircraft and engine size which will satisfy the requirements and be the least expensive to build or operate. Carpet plots can be used to overlay data showing performance relative to a baseline configuration for a hypothetical design case. (Author)

A79-36744 Recent results obtained with a new method for measuring aircraft power and drag in flight F W Smetana and S R Fox (North Carolina State University, Raleigh, N C.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790616* 9 p

Progress is reported in the development of a method to extract thrust horsepower and drag simultaneously from accelerated flight maneuvers. Although the flight data still are not as self-compatible as desired, the extracted drag and power obtained from a pullup-pushover agree reasonably well with the results from steady flight determinations for drag and wind tunnel tests for power. Further work is necessary to define the proper power model and to make the level flight acceleration data more self-compatible. (Author)

A79-36745 Development of the Beechcraft Model 77 J I Elliott and M L Holcomb (Beech Aircraft Corp., Wichita, Kan.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790617* 17 p

The Model 77 Skipper is the result of an intensive development program to develop an economical and efficient two-place general aviation trainer. The program was initiated as a flying test bed program which allowed great freedom for engineering evaluation of various aerodynamic, structural and mechanical concepts. This included the evaluation of different types of tail surfaces, high lift and lateral control devices, engines, propellers, etc. Along with the test bed, other tests were run with radio-controlled free flight and spin tunnel models. The test bed program was followed by the production engineering, testing and certification of the chosen production configuration. (Author)

A79-36746 * Full-scale wind-tunnel investigation of an Ayres S2R-800 Thrush Agricultural Airplane J L Johnson, Jr., H C McLemore, R White, and F L Jordan, Jr. (NASA, Langley Research Center, Hampton, Va.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790618* 83 p 8 refs

This paper summarizes the significant results of recent full-scale wind tunnel tests at the NASA-Langley Research Center of the Ayres S2R 800 Thrush Agricultural Aircraft. The purpose of the tests was to provide fundamental aerodynamic, performance, and stability and control information of the airplane and dispersal equipment, and to study near-field wake interaction characteristics behind the aircraft. The aerodynamic tests included the use of a propeller thrust-torque balance to measure the efficiency of the propeller in the presence of the engine and to provide data for determining slipstream interference effects and slip-stream drag. (Author)

A79-36747 * New opportunities for future small civil turbine engines - Overviewing the GATE studies W C Strack (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790619* 14 p

This paper presents an overview of four independent studies that explore the opportunities for future General Aviation Turbine Engines (GATE) in the 150-1000 SHP class. Detroit Diesel Allison, Garrett/AllResearch, Teledyne CAE, and Williams Research participated along with several airframers. These studies forecasted the potential impact of advanced technology turbine engines in the post-1988 market, identified important aircraft and missions, desirable engine sizes, engine performance and cost goals. Parametric evaluations of various engine cycles, configurations, design features, and advanced technology elements defined baseline conceptual engines for each of the important missions identified by the market analysis. Both fixed-wing and helicopter aircraft, and turboshaft, turboprop, and turboprop engines were considered. All four companies predicted sizable performance gains (e.g., 20% SFC decrease), and three predicted large engine cost reductions of sufficient magnitude to challenge the reciprocating engine in the 300-500 SHP class. Key technology areas were recommended for NASA support in order to realize these improvements. (Author)

A79-36748 Rolls-Royce RB 401-07 turboprop engine for business aircraft in the 1980's M A Wilson and R J Cant (Rolls-Royce, Ltd., London, England) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790620* 17 p

Rolls-Royce has identified a potential market in the business aircraft of the 80's for more efficient, economical, quieter and cleaner engines in the 5000 lb to 6000 lb thrust class. The mechanical design of the engine is characterized by using the low aspect ratio, low hub tip ratio titanium fan blades, the high pressure compressor, the vaporising type of annular combustor, the conventional two-stage design in the low-pressure turbine and the hydro-mechanical fuel control system. A noise level test has shown that, even without any acoustic treatment in the intake or fan duct, a significant margin of noise level exists below the regulations. It is concluded that greater range with higher rates of climb and cruising speed will all become achievable by applying current big engine technology to the small engine in a simpler form. V T

A79-36749 * A review of Curtiss-Wright rotary engine developments with respect to general aviation potential C Jones (Curtiss-Wright Corp., Wood-Ridge, N.J.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790621* 23 p 21 refs. Contracts No. NAS3-20030, No. NAS3-20808

Aviation related rotary (Wankel-type) engine tests, possible growth directions and relevant developments at Curtiss-Wright have been reviewed. Automotive rotary engines including stratified charge are described and flight test results of rotary aircraft engines are presented. The current 300 HP engine prototype shows basic durability and competitive performance potential. Recent parallel developments have separately confirmed the geometric advantages of the rotary engine for direct injected unthrottled stratified charge. Specific fuel consumption equal to or better than pre- or swirl-chamber diesels, low emission and multi-fuel capability have been shown by rig tests of similar rotary engine. A T

A79-36750 Electromechanical actuation for business aircraft D K Bird (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790622* 13 p 12 refs

The Air Force Flight Dynamics Laboratory's (AFFDL) approach to the utilization of electric power is to use direct electromechanical (EM) actuation for critical flight control application as in the fly-by-wire concept. The integrated hinge concept, as

applied to any of the conventional trailing edge surfaces, i.e., elevators, ailerons, or rudders is considered as the best potential for EM actuation. Two hardware units were built (one for NASA and one for AFFDL), each of them featuring inside-out motor design using rare earth samarium-cobalt permanent rotors with electronic commutation and powered with 270 V dc electrical power. Attention is paid to motor selection, current limiting and gear ratio selection, and some opinions concerning the future development of EM actuation and its future application to military, commercial transport, and business aircraft are given. V T

A79-36751 * A comparison of hydraulic, pneumatic, and electro-mechanical actuators for general aviation flight controls J Roskam, M Rice, and H Eysink (Kansas, University, Lawrence, Kan.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790623* 13 p 8 refs Grant No. NSG-1421

Mathematical models for electromechanical (EM), pneumatic and hydraulic actuators are discussed. It is shown that EM and hydraulic actuators provide better and faster time responses than pneumatic actuators but EM actuators utilizing the recently developed samarium-cobalt technology have significant advantages in terms of size, weight and power requirements. In terms of ease and flexibility of installation EM actuators apparently have several advantages over hydraulic actuators, and cost is a primary reason for the popularity of EM actuation for secondary control function since no additional systems need to be added to the aircraft. While new rare earth magnets are currently in developmental stage, costs are relatively high, but continued research should bring prices down. V T

A79-36752 A canister fuel pump for general aviation aircraft R R Goetz and R W Rothfus (Airborne Manufacturing Co., Elyria, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790624* 9 p

A new family of canister-type fuel pumps for use on both rotary and fixed-wing aircraft in general aviation use will be described. The pump, which features a wet-brush DC motor, offers advantages on aircraft where ease of maintenance and minimum downtime is very important. Major features of the new design, pump performance, and maintenance cost savings will be discussed. (Author)

A79-36753 * An experimental study of propeller-induced structural vibration and interior noise J T Howlett and J A Schoenster (NASA, Langley Research Center, Hampton, Va.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790625* 9 p 11 refs

This paper presents results of tests conducted to study fuselage sidewall dynamics and their effects on the cabin interior noise of a twin-engine, propeller-driven, light aircraft. Data on the dynamic behavior were obtained by slowly sweeping the RPM of one of the engines while the aircraft was stationary on the ground. This technique allowed frequency response plots of the sidewall structural accelerations to be obtained. These accelerations are compared to similar results from a test using a mechanical shaker in order to evaluate the structural dynamic response caused by the harmonics of the propeller blade passage tone. The dynamic response of the fuselage sidewall is also discussed as a noise transmission mechanism. A second mechanism for noise transmission through the fuselage sidewall was investigated by opening the copilot's window. The results illustrate the complex nature of the noise transmission mechanisms and the importance of correctly assessing noise paths. (Author)

A79-36754 * Engine induced structural-borne noise in a general aviation aircraft J F Unruh and D C Scheidt (Southwest

Research Institute, San Antonio, Tex.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790626* 15 p 8 refs Contract No. NAS1-14861

This paper describes a study of engine induced structural-borne noise in a single engine light aircraft. Cabin noise and fuselage vibration levels were recorded during ground tests for engine-attached, engine-detached, interior-installed, and interior-removed configurations. By comparisons of the data, engine induced structure-borne noise is shown to be a primary source of cabin noise. Corresponding fuselage vibration levels were quite high with energy concentrated mainly in the lower frequencies. A measure of the noise control effectiveness of the interior trim was also obtained. (Author)

A79-36755 * Summary of noise reduction characteristics of typical general aviation materials J Roskam, F Grosveld, and J van Aken (Kansas, University, Lawrence, Kan.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790627* 39 p 9 refs Grant No. NSG-1301

The paper presents the results of a large number of systematic tests to determine noise reduction characteristics of general aviation materials. Effects of material type (metallic and composite), thickness, panel stiffening, vibration damping materials, sound absorption materials and pressurization on noise reduction are included. Several promising methods for reducing cabin interior noise in light airplanes are discussed based on the results. (Author)

A79-36756 Effects of extended oil changes on aircraft piston engine wear and oil characteristics W E Garrelts (Illinois, University, Savoy, Ill.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790629* 13 p 6 refs

A79-36757 Detonation characteristics of Soviet GOST 1012-72 aviation gasoline J W Sibole, Jr (Avco Corp., Avco Lycoming Williamsport Div., Williamsport, Pa.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790630* 11 p

Chemical analyses, CFR engine knock tests, and a full scale turbocharged aircraft engine detonation test were conducted to compare the detonation characteristics of Soviet Grade GOST 1012-72 fuel and a commercially available Grade 100 Low Lead Aviation Gasoline. Chemical analysis indicated significant differences in the composition of the two fuels, particularly with respect to aromatic and tetraethyl lead contents. CFR engine knock test data indicated that the GOST 1012-72 fuel clearly was lower in knock value than the 100 Low Lead fuel, and full scale engine detonation testing supported these results. Modified detonation-imposed operating limitations were developed for the full scale aircraft engine model tested. No conclusions have been made with respect to long-term effects by GOST 1012-72 fuel usage on engine condition and performance. (Author)

A79-36758 Designing with damping materials to reduce noise and structural fatigue E O'Keefe (Specialty Composites Corp., Newark, Del.) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790631* 15 p 9 refs

The principal advantages of increased structural damping in aircraft components are design-cost and weight savings. The damping material is most conveniently presented, using the reduced temperature format which shows the loss factor and stiffness as a continuous function of both temperature and frequency. When the structural environment and damping properties are known, the composite panel behavior can be accurately determined from standard beam equations. In the present paper, some aspects of damping design for constrained layer dampers are discussed. Several case histories are

examined, where damping was successfully used to minimize aircraft and helicopter vibration and resonant noise problems V P

A79-36759 * Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise R J Jeracki, D C Mikkelsen, and B J Blaha (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790573* 22 p 44 refs

For the advanced turboprop to be competitive with proposed advanced turbofan-powered aircraft, it must have high propulsive efficiency at Mach 0.8 cruise above 9144-km altitude with an acceptable cabin noise environment. Four 8-bladed propeller models are designed employing various concepts to reduce compressibility losses. Wind tunnel tests are conducted at zero model incidence to the free-stream flow. Aerodynamic and acoustic test results are presented and discussed. It is shown that the aeroacoustically designed configuration (SR 3) with 45 deg of tip sweep and an area-ruled spinner yields the highest propulsive efficiency (78.7% at Mach 0.8, 3.06 advance ratio, and 1.7 power coefficient), with an improvement of about 3% over the straight bladed configuration (SR 2, with zero-degree sweep). The phase-interference concept for noise reduction used in SR-3 yields about 5-6 dB reduction as compared to SR-2. S D

A79-36760 * Effects of air injection on a turbocharged Teledyne Continental Motors TSIO-360-C engine D V Cosgrove and E E Kempke (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting and Exposition, Wichita, Kan., Apr 3-6, 1979, Paper 790607* 35 p 7 refs

Results are presented for tests performed to assess the effects of exhaust manifold injection air flow rate on emissions and on exhaust gas temperature and turbine inlet temperature for a range of engine operating conditions (speed, torque, and fuel-air ratios) of a fuel-injected turbocharged six-cylinder air-cooled Teledyne Continental Motors TSIO-360-C engine. Air injection into the exhaust gas at 80 F resulted in a decrease in hydrocarbons and carbon monoxide while exceeding the maximum recommended turbine inlet temperature of 1650 F at the full rich mixture of the engine. The EPA standards could be met within present turbine inlet temperature limits using commercially available air pumps, provided that the fuel-air ratios were leaned in the taxi, climb, and approach modes. S D

A79-36773 The Fairchild can-opener - Shturmovik of the eighties. *Air International*, vol 16, June 1979, p 267-272, 287

The close air support (CAS) Fairchild A10 Thunderbolt II is examined. Discussion centers on the essentially fair-weather aircraft's suitability to the adverse weather and other demanding conditions of a Central European scenario. Authorities contend that the aircraft is the best solution so far, to these problems. The A10's features such as high survivability resulting from heavy armor and triple redundant systems, and great firepower including a 30 mm Gatling type cannon and AGM-65 Maverick missiles are cited. The Tactical Air Command claims that attacking at an altitude of 100 ft or less at 350-370 knots the A10 will prove a difficult target. Among the electronic equipment the aircraft carries are a ALQ-119 jamming systems pod, a ALR-46V radar warning receiver, and chaff and IR flare dispensers. Modification of an A10 into a two seater for night and adverse weather duty is also discussed, as is a presentation of complete specifications. M E P

A79-36774 Airbus picks up speed - and the junior A310 takes off. *Air International*, vol 16, June 1979, p 278-286

The article details the commercial history and present situation of the Airbus, while presenting a cross section of the entire model array. Features of the different models, such as the Krueger flaps, the

Rolls Royce, Pratt and Whitney, and General Electric engines, are given in detail. Separate sections present the Airbus designations and list the number and model type which have been ordered by each customer airline. Development of the A 300 B10 into the A 310, noting the joint wing development by German and British design teams, is also discussed. The A 310 will have a smaller tailplane and a digital automatic flight control system allowing Category II certification with provisions for upgrading to Category III. Complete specifications of the A 310 are given and a comparison with the A 300 made. Finally, projected Airbus sales are analyzed, since Great Britain has returned as a full risk sharing partner in the program. M E P

A79-36775 In Soviet service V - Backfire. *Air International*, vol 16, June 1979, p 289-291, 308

The article discusses the Soviet Backfire bomber and the roles for which the aircraft may be used. While basically a tactical weapon, Arctic staging, in-flight refueling, and high altitude subsonic cruising would enable attacks on eastcoast US targets. The Backfire's low-risk design, which makes little use of new technology, and similarity to the TU-28P Fiddler is examined. The 'Downbeat' bombing and terrain following navigation radar is analyzed. Maximum take-off weight is about 260,000 lbs and length and width are 138 ft and 29.5 ft, respectively. The engines are believed to be based on the TU-144 turbofan, and performance estimates such as maximum dash speed of close to Mach 2 at about 39,370 ft are presented. Weapon load of the aircraft is about 21,000 lbs and use as a cruise missile launch platform is expected. It is concluded that at the present the Backfire, while a serious threat to Central Europe, possesses little strategic value in the intercontinental sense. M E P

A79-36797 # A starter for gas turbine engines (Ustroistvo dlia zapuska gazoturbinnogo dvigatelja) V I Daineko *Priborostroyeniye* (Kiev), no 24, 1978, p 75-79. In Russian

The present analysis deals with some aspects of calculating and designing air-injection-type starters for gas turbine engines. The schematic arrangement of the starter is examined, and structural factors affecting the dimensioning of the device are discussed. It is shown that the number of channels depends on the dimensioning constraints, the design and dimensions of the compressor inlet, and the nozzle throat diameter of the nozzle of each channel. V P

A79-36974 # Dassault-Breguet - The Mirage 2000 (Dassault-Breguet - Les Mirage 2000) J Morisset *Air et Cosmos*, vol 17, May 19, 1979, p 27, 28. In French

The performance and design characteristics of the Mirage 2000 are outlined. The aircraft, with an overall length of 15.3 m, is equipped with a SNECMA M 53-5 turbojet engine with a thrust of more than 10 tons at Mach 2.2 and 36,000 ft. Its range of operation with two pylon tanks (1700 l each) is greater than 1500 km. It can be equipped with two MATRA Super 530 and two MATRA 550 'Magic' air-to-air missiles. Results of initial flight tests have been highly satisfactory. C K D

A79-36975 # The Digibus multiplex at the heart of avionics (Le multiplex 'Digibus' au coeur de l'avionique) G Collin *Air et Cosmos*, vol 17, May 19, 1979, p 29, 30. In French

The Digibus digital bus developed for application in Mirage 2000, Mirage 4000, ANG, and F 1 is described. Two EMD-Sagem system management computers with memories of 32 and 64 k words form the core of the Digibus. A high degree of component standardization will permit adaptation of the system for use in ballistic missiles and submarines. Schematic diagrams of the Digibus developed for the Mirage 2000 are provided. C K D

A79-37044 # Changing requirements in aircraft design L M Nicolai (Defense Advanced Research Projects Agency, Arlington, Va) *Astronautics and Aeronautics*, vol 17, June 1979, p 22-31 10 refs

The evolution of paramount design requirements in the aircraft industry is outlined. Particular attention is given to the technological, societal, environmental, and economic pressures responsible for the rapid changes in major design requirements during the 1970's. The development of design requirements over the next 25 years is considered. It is concluded that future design requirements for commercial aircraft will include performance and long life, improved fuel efficiency and overall economy of operation, and compliance with noise and exhaust emission standards. Requirements for life-cycle costs, performance, and reliability in military aircraft will be expressed in higher kill rates and reduced cost for destruction of a given target. Emphasis in general aviation design will be on fuel efficiency, safety, comfort and cost. C K D

A79-37045 # Impact of advanced technologies on aircraft design J McCracken (Vought Corp., Dallas, Tex) and M R Robinson (Rockwell International Corp., Pittsburgh, Pa) *Astronautics and Aeronautics*, vol 17, June 1979, p 32-38 23 refs

Advanced aircraft system technologies and design process technologies that will characterize the next generation of aircraft are examined. Gross-weight reductions, increases in mission functions, and expected improvements in reliability and maintainability offered

A79-37046 # Computer graphics create the new wave of design A Feder (Northrop Corp., Hawthorne, Calif) *Astronautics and Aeronautics*, vol 17, June 1979, p 42-47, 51

The application of interactive computer graphics in advanced aircraft design, engineering analysis and production design is discussed. Advantages of this technology in terms of increased productivity, cost reductions and flexibility at each step of the design process are examined. Two- and three-dimensional geometry projections are noted. C K D

A79-37047 # Some main points about general-aviation design practice. M Newman (Douglas Aircraft Co., Long Beach, Calif) *Astronautics and Aeronautics*, vol 17, June 1979, p 48-50

A brief overview of general-aviation design practice is presented. Particular attention is given to the influence of model-year marketing pressures and the high-volume, low-cost production techniques characterizing this portion of the aerospace industry on the incorporation of product-improvement features. Data on general aviation aircraft production for major manufacturers are presented. C K D

A79-37048 # Design, meet production G L Michaelson (Boeing Commercial Airplane Co., Renton, Wash) *Astronautics and Aeronautics*, vol 17, June 1979, p 52, 53, 59

The paper discusses the importance of considering production costs as well as performance in designing aircraft. The potential for cost avoidance at different steps of the design, engineering and production sequence is considered. Attention is given to problems in developing producible designs for commercial aircraft interiors. C K D

A79-37050 # A case study in design - The Gossamer Condor P MacCready (AeroVironment, Inc., Pasadena, Calif) *Astronautics and Aeronautics*, vol 17, June 1979, p 60-63

The design strategy used in developing the Gossamer Condor, a man-powered light-weight wire-braced airplane, is discussed. Low operating power was the major design consideration, high priority was also given to ease of construction, repair and modification. Reflection on the performance of soaring birds and hang gliders contributed to the design concept, sophisticated design analysis techniques were used in moderation. An unconventional design approach proved highly successful in developing an unconventional aircraft. C K D

A79-37149 # Joint Airworthiness Requirements - Their history and progress A P Kennedy (Civil Aviation Authority, London, England) *Aircraft Engineering*, vol 51, May 1979, p 17-20

The formation process of Western European Joint Airworthiness Requirements (JAR) is examined. The Association Européenne des Constructeurs de Matériel Aérospatial (AECMA) consisting of Belgium, France, Germany, Italy, the Netherlands, Spain, Sweden, Switzerland and the United Kingdom began work on such codes in 1970. The aims, background and results of the work now attained are discussed. Separate sections deal with the airworthiness codes, Import/Export difficulties, certification of joint projects, JAR structure and general policy, and amendment procedure. Under the Airworthiness Codes section the U.K.'s decision to write their own after World War Two is discussed, while the Import/Export section cites the case of the Fokker F-27 and F-28 certification. In addition, a list of published documents is given. Future JAR regulations for sailplanes with and without engines are also covered. It is concluded that while work has been satisfactory in conception, adoption of JARs has been sluggish, which could erode the support they now have. M E P

A79-37150 # Inertial Referenced Flight Inspection System P R Vousden (Litton Systems, Ltd., Rexdale, Ontario, Canada) *Aircraft Engineering*, vol 51, May 1979, p 21-25

The development and features of the Inertial Referenced Flight Inspection System (IRFIS) which allows less costly and more accurate calibration of Category I, II, and III Aircraft Instrument Landing Systems, is presented. IRFIS utilizes aircraft velocity data measured by an Inertial Navigation System, while incorporating two mathematical error estimators, a sub-optimal Kalman filter and a Bryson-Frazier smoother. The Aircraft Position Sensor (APS) consisting of two infrared detector arrays mounted at 90 deg to each other in the aircraft pitch plane, is detailed as well as the ground mounted retroreflector. Design of the APS has met these criteria: all weather operation, no hazardous features, no interference with radio communications and no ground personnel or ground installation of expensive equipment. An onboard computer incorporating a CRT display and cassette magnetic tape storage is covered. Calibration procedure which consists of a 50 ft altitude pass over the runway is detailed. Other applications such as aerial surveying, photogrammetric operations, and airborne precision spraying can also be enhanced with IRFIS based equipment. M E P

A79-37238 The estimation of induced-voltage peak magnitude and energy level under LTA/EMP excitation of low-loss aircraft cabling W S McCormick (Wright State University, Dayton, Ohio) *IEEE Transactions on Electromagnetic Compatibility*, vol EMC-21, May 1979, p 136-146 8 refs. Contract No F33615-75-D-0090

The important vulnerability parameters of peak voltage transient magnitude and voltage transient energy are estimated for the LTA/EMP induction problem. Using basic linear system theory, straightforward expressions are derived to estimate these two survivability parameters. The derived model is quite general including cable characteristics, varying terminating impedances, and varying points of cable excitation. Using the developed model, a comparison of the LTA and EMP cases is made. An illustrative example involving the yaw damper circuit of the USAF F-111 is also included. (Author)

A79-37294 The McDonnell Aircraft Company Lightning Simulation Laboratory E H Schulte (McDonnell Aircraft Co., St Louis, Mo) *Journal of Environmental Sciences*, vol 22, May-June 1979, p 22-27 6 refs

The McDonnell Aircraft Company (MCAIR) Lightning Simulation Laboratory is equipped to conduct developmental lightning simulation tests as well as qualification tests on aircraft or aircraft assemblies. This paper describes how these techniques are applied at MCAIR in some of the unique generators used for conducting high-voltage, high-current, swept stroke, and induced-transient simulated lightning tests. This paper lists the various equipment and

facilities which are available at MCAIR for performing lightning simulation tests and gives examples of some of the tests performed (Author)

A79-37295 * # Control considerations for CCV fighters at high angles of attack. L T Nguyen, W P Gibert, and S B Grafton (NASA, Langley Research Center, Hampton, Va) *NATO, AGARD, Symposium on Aerodynamic Characteristics of Controls, Naples, Italy, May 14-17, 1979, Paper 11 p*

Wind tunnel and piloted simulation studies show that the use of the CCV concept of relaxed static pitch stability on fighter aircraft at high angles of attack can result in pitch departures caused by inertia and/or kinematic coupling and in deep stall trim. These problems can be avoided by sufficient nose-down pitch control at high attack angles, and effectiveness of several pitch control configurations such as aft-mounted stabilators, canard mounted flaps, and all-movable canards was investigated. A variable incidence canard with a large travel range was the most effective means of obtaining the required pitch control, although very large deflections may be required on highly unstable configurations. Control laws were developed for cases where the high angle of pitch control requirement is not met, but they can limit aircraft roll capability and thus compromise maneuverability. A T

A79-37296 * # A unique facility for V/STOL aircraft hover testing. R G Culpepper (NASA, Langley Research Center, Hampton, Va) and R D Murphy (US Navy, Naval Air Systems Command, Washington, D C) *Workshop on V/STOL Aerodynamics, U S Naval Postgraduate School, Monterey, Calif, May 16-18, 1979, Paper 28 p*

The paper discusses the Navy's XFV-12A tethered hover testing capabilities utilizing NASA's Impact Dynamic Research Facility (IDRF) at Langley. The facility allows for both static and dynamic tethered hover test operations to be undertaken with safety. The installation which consists of the 'Z' system (tether), restraint system, static tiedowns and the control room and console, is presented in detail. Among the capabilities demonstrated were the ability to recover the aircraft anytime during a test, to rapidly and safely define control limits, and to provide a realistic environment for pilot training and proficiency in VTOL flight. M E P

A79-37468 # Vertical cutoff rigidity and the intensity distribution of cosmic rays near Cape Town. P J Konig, A J v d Walt, P H Stoker, B C Raubenheimer (Potchefstroom University for Christian Higher Education, Potchefstroom, Republic of South Africa), M A Shea, and D F Smart (USAF, Geophysics Laboratory, Bedford, Mass) In *International Cosmic Ray Conference, 15th, Plovdiv, Bulgaria, August 13-26, 1977, Conference Papers Volume 4*. Sofia, B'lgarska Akademiia na Naukite, 1978, p 173-177. 6 refs. Research supported by the South African Council for Scientific and Industrial Research.

A fairly sharp increase of 2.3% in the intensity of the nucleonic component of cosmic rays was observed at 30,000 feet pressure altitude along a contour of constant calculated vertical cutoff rigidity on a research flight from Cape Town, South Africa, at 18 deg E longitude, to a point 2 deg W longitude. The increase seems to be an inherent feature of this region near the South Atlantic geomagnetic anomaly. Detailed cutoff rigidity calculations in vertical and inclined directions revealed that the observed increase may at least partly be ascribed to variation in effective cutoff rigidities along the route. However, the increase could also be attributed, at least as far as morphology is concerned, to the continuous precipitation in a restricted area of those high energy inner radiation belt protons that have short lifetimes. (Author)

A79-37573 # Observation of atmospheric interactions at aeroplane altitude. F Fumuro, R Ihara (Kwansei Gakuin University, Nishinomiya, Japan), T Ogato, H Sugimoto (Tokyo, University,

Tokyo, Japan), and Y Sato (Waseda University, Tokyo, Japan) In *International Cosmic Ray Conference, 15th, Plovdiv, Bulgaria, August 13-26, 1977, Conference Papers Volume 7*. Sofia, B'lgarska Akademiia na Naukite, 1978, p 171-176.

A large gamma-ray family is observed with a emulsion chamber exposed at aircraft altitude (260 g/sq cm). This gamma-ray family represents the feature of atmospheric nuclear interactions directly. Experimental results are presented on the energy, transverse momentum, and angular distribution of secondary gamma rays. The analysis of this family is made by use of calculated results of three dimensional cascade theory and of the kinematical method. (Author)

A79-37725 The 'cloud-in-cell' technique applied to the roll up of vortex sheets. G R Baker (California Institute of Technology, Pasadena, Calif) *Journal of Computational Physics*, vol 31, Apr 1979, p 76-95. 36 refs. Contract No AT(04-3)-767, Grant No DAHC04-68-C-0006.

The cloud-in-cell technique is used to calculate the time evolution of a vortex sheet generated by a wing in an ideal fluid. Two cases are considered for the initial distribution of circulation: one corresponding to an elliptically loaded wing and the other simulating the wing with a flap deployed. Results indicate that small scale behavior plays an important role in the roll-up. Typically, small scale perturbations result in small structures which evolve into ever increasing larger structures by vortex amalgamation. B J

A79-37735 Application of parameter identification techniques to analysis of flight data. A J Ross (Royal Aircraft Establishment, Farnborough, Hants, England) *Progress in Aerospace Sciences*, vol 18, no 4, 1979, p 325-349. 35 refs.

The paper presents an outline of the parameter identification techniques currently used to extract aerodynamic data from flight tests, the emphasis being on the determination of stability and control derivatives. Consideration is given to the following techniques: equation error methods, output error methods, generalized least squares method, and maximum likelihood methods. Some advantages and difficulties of the methods are discussed, and some examples of results obtained from research and demonstration flying are examined. B J

A79-37827 # The evaluation of the weight of engine installations on transport aircraft (Sulla valutazione del peso degli impianti motopropulsori dei velivoli da trasporto). G Gabrielli *Ingegneria*, Mar-Apr 1979, p 65-69. 9 refs. In Italian.

Expressions for engine installation weight as a function of thrust developed at take off are derived for transport aircraft. Engine weight assessments are presented for both propeller and jet aircraft and are intended as an aid in the preliminary design of aircraft with externally mounted power plants. The engine weight expressions are empirical formulations based on statistical elements. J M B

A79-37828 # Radial equilibrium in axial turbomachines (L'equilibrio radiale nelle turbomacchine assiali). G De Michele (Franco Tosi S.p.A., Legnano, Italy), G A Danieli, and G Florio (Calabria, Università, Cosenza, Italy) *Ingegneria*, Mar-Apr 1979, p 70-83. 7 refs. In Italian.

A review is presented of the theoretical foundations of the radial equilibrium model, a mathematical approach for fluid dynamic calculations applicable to axial turbines. The radial equilibrium model is based on a consideration of nonviscous, axisymmetric, potential flow in the meridian plane of the turbomachine. The radial distribution of a free parameter in the flow treatment provides a design tool for optimizing the fluid dynamic output of the turbomachine. J M B

A79-37852 Fossil fuel heat pumps for domestic, commercial and industrial space heating R E Critoph (Open University, Milton Keynes, Buck., England) In *International Conference on Future Energy Concepts*, London, England, January 30-February 1, 1979, Proceedings London, Institution of Electrical Engineers, 1979, p 61-64

It is noted that fossil fuel heat pumps are more efficient than electric ones. The present paper gives a description of the OUEG/Lucas gas-fueled heat pump, presents a schematic diagram and photographs of the device, and discusses predicted performances. B J

A79-38058 # Turbulent wake measurements with a laser velocimeter J F Meyers (U.S. Army, Instrument Research Div., Hampton, Va.) and D R Hoad (U.S. Army, Structures Laboratory, Hampton, Va.) *American Institute of Aeronautics and Astronautics, Thermophysics Conference, 14th, Orlando, Fla., June 4-6, 1979, Paper 79-1087* 9 p 12 refs

An investigation has been conducted in the Langley V/STOL tunnel with a laser velocimeter to demonstrate the capabilities of this technique through measurements of airflow velocities in the wake region of a NACA 0012 wing in stall and cruise angles of attack (19.4 deg and 47.5 deg). A direction-sensitive, two component, fringe-type laser velocimeter with a focal length of 3.86 m to reach center span was used with high speed burst counter and minicomputer data acquisition and processing. The size of the seeding particles was measured and the velocity lag error determined along with errors due to the instrumentation. The measured velocities were found to have a bias uncertainty of 1.33 percent to 0.91 percent and a random uncertainty of + or - 0.47 percent (Author)

A79-38090 Fuel on fire - Rapid response to a military problem D Boyle *Interavia*, vol 34, June 1979, p 554-556

Equipment developed by Gravier England for extinguishing fuel fires in aircraft is analyzed, considering that such a system has to operate in milliseconds if suppression is to be effective. Two methods of detection are presented: (1) detection of the impact shock wave through the fuel tank, and (2) detection of flame radiation. The latter, by reacting only to a flame, eliminates the possibility of releasing extinguishant when no fire has occurred. The ultraviolet sensor which consists of a hydrogen and inert gas filled glass bulb containing two metal electrodes is discussed in detail. Its quick response time allows for several 'readings' per millisecond, thus reducing the chance of errant flashes or rays triggering the system. An explosive charge releases the potassium cryolite extinguishant from the cone shaped suppressor unit. The results of a demonstration for the U.S. Army are presented, noting various contract possibilities. M E P

A79-38091 Survivability in aircraft fires - New standards are needed C Bulloch *Interavia*, vol 34, June 1979, p 557, 558

The fire resistance of aircraft cabin materials in respect to design and certification is discussed. Improved testing procedures are called for as materials that have passed current specifications as 'self extinguishing' have been proven to propagate flame, noting criticisms that laboratory tests involving small samples do not adequately reproduce the aircraft cabin environment. The FAA has modified a C 133 with a false floor and ceiling to create a widebody cabin with full instrumentation provided to record heat flux, smoke density, and gas concentration in various parts and levels of the cabin. The complete data capability will include 128 channels of computer acquired information, gas sample analyses, test animal responses and video coverage of the cabin. Results to date include fairly precise analysis of the time required for dangerous heat levels to occur. A mathematical model of a cabin fire under development, and possible use of additives to reduce split fuel flammability are covered. The lack of up-to-date FAA regulations is also discussed. M E P

A79-38092 Westland unveils WG30 transport helicopter D Wood *Interavia*, vol 34, June 1979, p 575-577

The Westland WG-30 transport helicopter is previewed. The medium size, high performance helicopter is intended for military and civilian use. Complete specifications regarding capacity, dimensions, weights, and performance are given. The WG-30 differs from the earlier Lynx in having increased rotor diameter, 'raft' mounted engine and rotor assembly, and a new automatic flight control system. The use of a minimum number of cleat sizes is covered, noting that as a result, the WG-30 has half the structural components of the Lynx with only a 30 lb weight penalty. Lynx items retained in the newer model, include the nose and tail structure. Twin Rolls Royce GEM 41-4 turboshaft engines with a maximum rating of 1,120 shp, allow a maximum cruise speed of 135 knots. A duplex pitch, roll, and yaw system with computer based control and duplex heading hold is employed and a complete VOR, DME, ILS, and ADF package will be tested for IFR operation. In the military role the WG-30 is seen as a tactical transport and for battlefield support. With tropical performance modifications it is hoped the craft's market will extend to the Middle and Far East. M E P

A79-38118 # Rotor blade stability in turbulent flows I Y K Lin (Illinois, University, Urbana, Ill.), Y Fujimori (National Aerospace Laboratory, Tokyo, Japan), and S T Ariaratnam *AIAA Journal*, vol 17, June 1979, p 545-552 25 refs Grant No DAAG29-78-G-0039

The effect of turbulence in the atmosphere on the motion stability of a helicopter blade is investigated. Modeling turbulence as a random field, statistically stationary in time and homogeneous in space, the method of stochastic average of Stratonovich (1967) is used to obtain equivalent Ito stochastic equations, from which the Fokker-Planck equation for the transition probability density and the equations for various stochastic moments can be derived. As an exploratory study, only flapping and torsional motions are considered. Equations of motion are derived which are reducible to those obtained previously by Sisingh and Kuczynski when the turbulence terms are removed. The in-plane turbulence components appear in the coefficients of these equations, thus, they affect the stability of the flapping and torsional motions. On the other hand, the normal turbulence component appears in the inhomogeneous terms in the equations, its statistical properties, while affecting the level of system response, do not change a stable solution to an unstable solution (Author)

A79-38123 * # Transient ablation of Teflon in intense radiative and convective environments N Arai (NASA, Ames Research Center, Moffett Field, Calif.) *AIAA Journal*, vol 17, June 1979, p 634-640 13 refs

On the basis of this investigation of the high-temperature behavior of polytetrafluoroethylene (PTFE), the transient one-dimensional ablation of PTFE has been developed by taking into account the optical transmittance of both the amorphous zone and the crystalline zone of PTFE layer. Results show that although the exposed surface receded at an apparently steady state, both the internal temperature and the thickness of the gel layer increase continuously due to the internal absorption of radiation (Author)

A79-38124 # Effect of forward acceleration on aerodynamic characteristics of wings S Ando (Nagoya University, Nagoya, Japan) and A Ichikawa *AIAA Journal*, vol 17, June 1979, p 653-655 7 refs

A new theoretical formulation is presented for a three-dimensional wing flying with nonuniform speed in an incompressible inviscid fluid. General formulations are presented and some applications for the lift problem are given including the cases of slender wings and two-dimensional airfoils. B J

A79-38131 F-18 - A special report. M Shohat and F C Berry, Jr *Military Electronics/Countermeasures*, vol 5, May 1979, p 29, 30, 32 (4 ff)

One of the concepts driving F-18 Hornet development is to produce a multimission aircraft designed for reliability and maintainability, and whose cost of ownership is reduced by comparison with present aircraft. Medium and large scale integrated circuits, solid state electronics, switching, and computer memory are heavily used and derating of electronics equipment contributes directly to reliability from the outset. The aircraft has built-in tests not only in the avionics systems but in some of the mechanical systems as well, with fighter and attack versions completely common in basic aircraft hardware and software. It is also noted that the maintainability and reliability standards are now requirements, not goals as in earlier aircraft. The entire full scale development program is reportedly valued at around \$2 billion beginning in 1976, with 11 aircraft fully engaged in test flying by the year-end of 1979 and squadron service to begin in 1982. V T

A79-38132 The intercept of covert radar. R G Siefker *Military Electronics/Countermeasures*, vol 5, May 1979, p 56, 94

The geometry of intercept falls into one of two general categories: the interceptor either is or is not colocated with the target. The definition of a new term called the 'radar advantage' establishing the edge that radar must hold in order to be undetected while tracking a target is given. Two examples covering most typical cases are presented using a radar range vs intercept range chart. In the first, a radar operator is tasked with not letting an electronic intelligence collector get close enough to intercept his radar, in the second, the radar designer is tasked to design a radar that can track a target at 10 km without the target's own ship sensors becoming aware of the covert act. Either example can be worked backwards to aid the interceptor designer in system specification and required ranges. V T

A79-38135 * # Some observations on the mechanism of aircraft wing rock. C Hwang and W S Pi (Northrop Corp., Aircraft Group, Hawthorne, Calif.) *Journal of Aircraft*, vol 16, June 1979, p 366-373. 6 refs. Contract No. NAS2-8734

A scale model of the Northrop F 5A was tested in NASA Ames Research Center Eleven-Foot Transonic Tunnel to simulate the wing rock oscillations in a transonic maneuver. For this purpose, a flexible model support device was designed and fabricated, which allowed the model to oscillate in roll at the scaled wing rock frequency. Two tunnel entries were performed to acquire the pressure (steady state and fluctuating) and response data when the model was held fixed and when it was excited by flow to oscillate in roll. Based on these data, a limit cycle mechanism was identified, which supplied energy to the aircraft model and caused the Dutch roll type oscillations, commonly called wing rock. The major origin of the fluctuating pressures that contributed to the limit cycle was traced to the wing surface leading edge stall and the subsequent lift recovery. For typical wing rock oscillations, the energy balance between the pressure work input and the energy consumed by the model's aerodynamic and mechanical damping was formulated and numerical data presented. A79-38136 # Aeroelastic stability analysis of the AD-1 manned oblique-wing aircraft. M J Rutkowski (U.S. Army, Aero mechanics Laboratory, Moffett Field, Calif.) *Journal of Aircraft*, vol 16, June 1979, p 401-406. 23 refs.

The AD-1 manned flight test program being conducted jointly by the Ames and Dryden Flight Research Centers of NASA is intended to evaluate the stability, control, and handling characteristics of oblique wing aircraft. The results of the aeroelastic stability analysis carried out at Ames in support of the AD-1 program are presented for the oblique wing, both with and without ailerons. When the wing is swept, the significant mode of instability is

low-frequency, oblique-wing flutter. With the oblique unswept, however, the critical mode is bending-torsion aileron flutter. The latest version of the NASTRAN computer code, as well as the Ames PASS/FLUT program, was used in these studies. (Author)

A79-38137 # A tire runway interface friction prediction model concept. M K Wahi (Boeing Commercial Airplane Co., Seattle, Wash.) *Journal of Aircraft*, vol 16, June 1979, p 407-416. 39 refs. Contract No. F33657-74-C-0129

A thorough literature survey was conducted to establish the range of aircraft tires in use, types of runway surfaces in use, and a list of factors affecting tire runway interface phenomenon. Both commercial and military aircraft tires and runways were studied. Subsequently, a prediction model has been developed that correlates with existing tire test data to within plus or minus 5%. The model consists of a prediction equation expressing the relationships between seven dimensionless groups (π terms) needed to define the tire runway interface friction. Due to lack of availability of uniform test data, a tire test program has been recommended to validate the said model. (Author)

A79-38140 # Aircraft design and strength /2nd revised and enlarged edition/ (Konstruktsiia i prochnost' samoletov /2nd revised and enlarged edition/). V N Zaitsev and V L Rudakov. Kiev, Izdatel'stvo Vishcha Shkola, 1978. 488 p. 48 refs. In Russian.

This second edition of the textbook has been extended to include a number of issues and problems associated with the progress made in aircraft design over the past few years. Particular attention is given to new requirements concerning the strength, reliability, dynamic creep, and fatigue strength of an aircraft and its assemblies and components. The structure diagrams of various systems and mechanisms are examined. V P

A79-38145 # Theoretical fundamentals of radio altimetry (Teoreticheskie osnovy radiovysotometrii). A P Zhukovskii, E I Onoprienko, and V I Chizhov. Moscow, Izdatel'stvo Sovetskoe Radio, 1979. 320 p. 133 refs. In Russian.

A theory of air and space-borne radio altimeters and vertical velocimeters is developed. The principles of designing such instruments and obtaining information on height and vertical speed are outlined. The operational characteristics of radio altimeters, associated with the random nature of a signal reflected from a statistically uneven surface are discussed. The accuracy of radio altimeters is studied by statistical analysis and synthesis methods. Techniques for calculating dynamic and other errors of radio altimeters are described. V P

A79-38168 # Profiling of two-dimensional and three-dimensional nozzles and calculation of their flows (Profilirovanie dvumernykh i prostanstvennykh sopel i raschet techeniia v nikh). M Ia Ivanov and A N Kravko. In Gasdynamic lasers and laser photochemistry. Moscow, Izdatel'stvo Moskovskogo Universiteta, 1978, p 52-62. 43 refs. In Russian.

The paper deals with some problems associated with designing plane, axisymmetric, and three-dimensional nozzles for a desired flow at the exit section or for optimum thrust. Some aspects of the calculation of nozzle flows for a given nozzle configuration, with allowance for nonequilibrium physicochemical processes, are discussed. V P

A79-38387 The effect of hydrogen addition on ignition delays and flame propagation in spark ignition engines. M J Rauckis and W J McLean (Cornell University, Ithaca, N.Y.) *Combustion Science and Technology*, vol 19, no 5-6, 1979, p 207-216. 21 refs.

The results of an experimental investigation of the effect of supplemental hydrogen (up to 30 percent of the total fuel energy) on the combustion process in a CFR engine are reported. The hydrogen was added under otherwise constant conditions so that chemical

properties were varied under constant hydrodynamic conditions. Calibrated cylinder pressure traces, averaged over many cycles, were incorporated into a two-zone thermodynamic analysis to determine the mass fraction burned as a function of crankangle. The techniques employed enabled changes in the induction period and combustion duration of the order of 0.1 ms to be resolved. The added hydrogen resulted in significant reductions in ignition delay or induction times, especially in lean mixtures. Reductions were greater with increased fractions of hydrogen. Once a turbulent flame was well established, the hydrogen had a relatively small effect on the burning rate. The results are consistent with a description of the combustion process which includes an induction period dominated by chemical dynamic effects and a turbulent burning period dominated by turbulent transport effects. Added hydrogen also led to improved efficiency and less cycle-to-cycle pressure variations. (Author)

A79-38393 * Effects of forward velocity on sound radiation from convecting monopole and dipole sources in jet flow. R. Dash (NASA, Ames Research Center, Moffett Field, Calif.) *Journal of Sound and Vibration*, vol. 64, May 22, 1979, p. 187-207. 26 refs.

A theoretical model is presented of the effects of forward velocity of an aircraft at arbitrary subsonic speed on sound radiated from convecting monopole and dipole sources embedded in the jet flow. It is found that with increasing forward velocity there is a steadily increasing amplification (over the static case) of the sound radiated into the forward arc and a large reduction of the sound which is radiated into the rearward arc. The same trend is also shown to result when there is a reduction in the exhaust velocity, with, however, a further rise in amplification in the forward quadrant and a drop in attenuation in the aft quadrant. B J

A79-38399 Noise characteristics of heated high velocity rectangular jets. R. A. Kantola (GE Mechanical Systems and Technology Laboratory, Schenectady, N.Y.) *Journal of Sound and Vibration*, vol. 64, May 22, 1979, p. 277-294. 14 refs. U.S. Department of Transportation Contract No. OS 30034.

A comprehensive experimental investigation of the noise emission from a rectangular jet has been carried out. In order to provide information pertinent to the operating conditions of jet engines, this study was conducted with a wide range of jet velocities and temperatures. A substantial effort has been made to present the information in this paper in such a fashion as to delineate the effects of turbulent mixing and acoustic shielding. To aid in this process, a round jet with an equal area nozzle was also tested over the same ranges of velocity and temperature. As a result of this study, it is concluded that an observed reduction in overall acoustic power of the rectangular jet, when compared to a round jet, is mainly the result of the shielding effects of the mean velocity and temperature fields rather than due to any turbulent mixing phenomenon. Acoustic shielding predictions were found to be qualitatively valid in the vicinity of the peak intensity but were inadequate at shallow angles to the jet axis. In order for shielding theory to properly predict the noise of non-circular jets, at shallow angles, it appears that it will be necessary to include the effects of jet spreading and subsequent degeneration to a circular jet as well as the effects of off-axis source locations. (Author)

A79-38476 Sidestick/Throttle Controller - An alternate approach. F. Gregory (USAF, Washington, D.C.) *Society of Experimental Test Pilots, Technical Review*, vol. 14, no. 3, 1979, p. 4-15.

A simulation was made to determine if a pilot using a single hand Sidestick/Throttle Controller (SSTC) could provide precise and effective aircraft control comparable to that of a conventional center stick and left-hand throttle. The construction of the SSTC, the Visual Motion Simulator (VMS) and the Differential Maneuvering Simulator (DMS) used during the evaluation conducted at the NASA Langley Research Center, together with the test procedures are described. The VMS pilot comments were that the SSTC is an acceptable alternative to aircraft control and that preliminary data

analysis indicates no significant difference between the conventional controller and the SSTC, that throttle manipulation appears as a subconscious act with the SSTC, and with the exception of roll sensitivity, the roll and pitch interface harmony and the mechanical characteristics of the SSTC were acceptable. The DMS conclusions rated the SSTC as acceptable and equal or better than the conventional controls for a majority of DMS tasks, that hand fatigue can be expected with rapid and large displacement throttle manipulations while significantly displacing the SSTC from lateral or longitudinal neutral, and that preliminary data analysis indicates no significant difference in performance between the SSTC and conventional controller. A T

A79-38477 A wind shear/downdraft drift angle warning system. R. A. Greene *Society of Experimental Test Pilots, Technical Review*, vol. 14, no. 3, 1979, p. 16-21. 8 refs.

This paper describes the development of an airborne system, which determines the reduction in excess thrust available during a landing approach. The system measures, with no appreciable lag, the effective loss in available excess thrust-to-weight ratio due to downdraft drift angle and horizontal wind shear. These signals are summed in terms of radians and acceleration g's and are presented to the flight crew in the form of a go-around alert. (Author)

A79-38478 The test pilot in the airline industry or 'My bags are packed and I'm ready to go'. C. Kizer (United Air Lines, Inc., Chicago, Ill.) *Society of Experimental Test Pilots, Technical Review*, vol. 14, no. 3, 1979, p. 22-26.

The engineering functions, personnel qualifications and the organization of the Flight Test Section at United Airlines are described and types of test flights, flight test requirements, and details of maintenance operations are outlined. A Flight Test Audit Program which randomly selects fleet aircraft for flight checks and helps determine system function and reliability in the operating fleet environment, and a program to allow Flight Test Section a greater impact on the existing maintenance plan are depicted. A T

A79-38479 Night/Adverse Weather A-10 evaluator program. W. H. Shawler (Fairchild Republic Co., Farmingdale, N.Y.) *Society of Experimental Test Pilots, Technical Review*, vol. 14, no. 3, 1979, p. 27-30.

The program to extend the A-10 mission capability to the Night/Adverse Weather (N/AW) regime by demonstrating aircraft operability and survivability with low altitude attack and integrating tactics and sensors to destroy the threat is described. The N/AW capability will increase the A-10 usable time to over 90% in the European environment with enhanced avionics such as Inertial Navigation System, Radar, Forward Looking Infrared, Radar Altimeter, and Laser Ranger. The mission analysis to determine the required avionics subsystems and equipment is discussed together with the major tasks required to accomplish the program, including modification into a two-place N/AW evaluator, integration of the N/AW avionics, and demonstration of the N/AW capability. The test program is described, noting that a crew of two is needed to accomplish the low altitude mission at night and/or adverse weather, at least two sensors should provide information at all times, and the cockpits should be designed with maximum flexibility with control provisions in both cockpits and capability to display sensor information both Heads Up and Heads Down. A T

A79-38531 Identification of voltage transients on aircraft cabling under LTA excitation. W. S. McCormick (Wright State University, Dayton, Ohio) and K. J. Maxwell (Technology Scientific Services, Inc., Dayton, Ohio) *IEEE Transactions on Aerospace and Electronic Systems*, vol. AES-15, May 1979, p. 372-377. Contract No. F33615-75-D-0090.

Lightning and electro-magnetic pulse-induced fuselage skin currents can magnetically or electrically flux couple onto aircraft cabling through dielectric 'holes' or apertures in the aircraft fuselage. Using lightning transient analysis (LTA) input-output waveform records, frequency domain techniques are presented that locate the exact point of excitation. The techniques are demonstrated using an RG-58 cable simulation and are then applied to the yaw damper circuit of a USAF F-111 (Author)

A79-38532 A family of air traffic control radars E Giaccari and G Nucci (Selenia S.p.A., Rome, Italy) *IEEE Transactions on Aerospace and Electronic Systems*, vol AES-15, May 1979, p 397-404 12 refs Contract No N00014-78-C-0257

Some 20 years of activity in the field of air traffic control radars is described. The technical experience gained in evaluating the performance of ATC radars installed throughout the world is described in terms of target visibility in the clear, a ground clutter, and in adverse meteorological conditions. A criterion to determine the significance of a flight test is described. In the effort to establish a reliable method of measurement, the subclutter visibility over ground clutter is related to the linear dynamic range of the moving-target indicator (MTI) receiver and to the improvement factor (Author)

A79-38533 Digital flight control research using microprocessor technology R F Stengel (Princeton University, Princeton, N.J.) (*Flight Control Systems Criteria Symposium, U.S. Naval Postgraduate School, Monterey, Calif., July 1978*) *IEEE Transactions on Aerospace and Electronic Systems*, vol AES-15, May 1979, p 397-404 12 refs Contract No N00014-78-C-0257

The Flight Research Laboratory at Princeton University is engaged in an experimental program to investigate a variety of approaches to digital control by actual flight test. Experimentation is being conducted with Princeton's 6-DOF variable-response research aircraft (VRA), which is equipped for direct side-force control, direct-lift control, feedback of all motion variables, and multiple-pilot command modes. VRA avionics have been augmented by microprocessor digital flight control system (Micro-DFCS), which uses off-the-shelf computer components capable of operating in parallel or in series with the existing variable-response system. The digital control laws operate in conjunction either with the 'bare airframe' dynamics of the VRA or with the dynamics of a simulated aircraft, provided by the existing variable-response system. The initial flight control computer program CAS-1 provides three longitudinal control options: direct (unaugmented) command, pitch rate command, and normal acceleration command (Author)

A79-38706 Air Force Space Laser Communications J R Roland and C E Whited (USAF, Space and Missile Systems Organization, Los Angeles Air Force Station, Calif.) In *ITC/USA/78, Proceedings of the International Telemetering Conference*, Los Angeles, Calif., November 14-16, 1978, p 339-346 Pittsburgh, Pa., Instrument Society of America, 1978, p 339-346

The background and status of the AF LASERCOM program are briefly reviewed. The performance characteristics of the LASERCOM system make its potential application to certain satellite-satellite and satellite-aircraft links unique, while other potential LASERCOM links require a detailed cost analysis of the current investment in RF terminals and systems vs the cost of developing and deploying LASERCOM terminals and systems B J

A79-38814 # Model study of transient processes in a hydraulic power amplifier (Badania modelowe procesow przejsciowych hydraulicznego wzmacniacza sily) G Janowska and J Morawski *Instytut Lotnictwa, Prace*, no 72, 1978, p 3-24 In Polish

The paper deals with a hydraulic analog of a power amplifier incorporated in a helicopter control system. The results of the analysis are discussed, with particular reference to the influence of the principal functional and structural characteristics of the amplifier on its transient response V P

A79-38816 # Model study of aircraft disk brakes (Badanie modelowe lotniczych hamulcow tarczowych) A Derkaczew *Instytut Lotnictwa, Prace*, no 72, 1978, p 53-81 7 refs In Polish

The model test for aircraft disk brakes, proposed in the present paper, is based on the use of modern concepts of similarity theory and the theory of friction and wear. A group of parameters which affect decisively the similarity aspects of the test are identified, along with the conditions which must be satisfied to provide a modeling accuracy adequate for designing aircraft disk brakes V P

A79-38817 # Tachystoscopic testing of onboard instruments (Badania tachistoskopowe przyrzadow pokladowych) Z Kazimierska *Instytut Lotnictwa, Prace*, no 73, 1978, p 3-25 18 refs In Polish

Some problems in the tachystoscopic testing of aircraft indicator instruments are addressed. The ergonomic optimization of some existing indicator instruments and proposed new ones is studied on the basis of some legibility tests, in which the minimum time necessary for correct reading was measured. Results of legibility tests performed in the design process for some fuel gages and gyrocompasses with integral lighting are discussed P T H

A79-38819 # A method of reducing aircraft turbine blade vibrations (O pewnej metodzie zmniejszania drgan lopatek turbin lotniczych) W Klepacki *Instytut Lotnictwa, Prace*, no 74, 1978, p 11-40 In Polish

A vibration damper for aircraft turbine blades is described. The effectiveness of the device is evaluated by measuring the stress in the blade itself and the neck of the blade root before and after the vibration damper is installed. Stress amplitude reductions of up to around 70% are possible with the device. A mathematical model of the damper is proposed, and an analog method of analysis is described. These two methods give satisfactory results for predicting the effectiveness of the damper installation P T H

A79-38825 High level maintenance below sea level L M Kolsteeg (KLM - Royal Dutch Airlines, Engineering and Maintenance Div., Amsterdam, Netherlands) *Exxon Air World*, vol 31, no 2, 1979, p 22-26

The KLM Amsterdam Schiphol Airport engine overhaul shop is responsible for maintenance and overall engineering of about 200 CF6 engines. Modular design and on condition maintenance philosophy, the two basic concepts of modern engine care, introduced new common industry terminology, Modules or Maintenance Units, Hospital and Hospital Visit, Shop and Shop Visit, Hospital Maintenance Unit and On Condition Maintenance which are defined. Inspection methods including borescope, evaluation of magnetic slip detectors, Gamma-ray and oil sample checks are listed, noting that on condition maintenance philosophy, together with failure analysis, revealed the life-limited components which should be scheduled for replacement. The engine component inspection, repair and maintenance steps through the shop are detailed, noting the role of production control, engineering, quality assurance, finance and production experts. Finally, the repaired components and modules are rebuilt into a complete engine and given a test cell performance run A T

A79-38882 * Exploring team avionics systems by simulation G A Brent and T M McCalla, Jr (Southern Illinois University, Carbondale, Ill.) In *Annual Simulation Symposium*, 11th, Tampa, Fla., March 15-17, 1978, Record of Proceedings, Tampa, Fla., Annual Simulation Symposium, Long Beach, Calif., IEEE Computer Society, 1978, p 155-170 12 refs Grant No NsG 2238

Configurations of software and hardware in a no-critical element team architecture are under study for future general aviation aircraft avionics. The team integrated avionics system, based on microprocessors, can monitor and partially interpret all flight instrument data,

engine parameters, and navigation information faster than a human pilot. Simulation programs based on an event-oriented simulation language are being used to design team architectures. J M B

A79-38885 An aircraft simulation using a product of exponentials as matrixant. K R Penrose (USAF, Ogden Air Logistics Center, Hill AFB, Utah) In Annual Simulation Symposium, 11th, Tampa, Fla., March 15-17, 1978, Record of Proceedings.

Tampa, Fla., Annual Simulation Symposium, Long Beach, Calif., IEEE Computer Society, 1978, p. 253-269.

An aircraft simulation is described wherein direction cosine matrices are updated by premultiplication with exponential matrices which represent rotations occurring during 50 millisecond intervals. Equations and algorithms are presented which determine the aircraft state in inertial and other coordinate systems, based on aerodynamics and environmental factors. Techniques for fast, accurate real time execution are used throughout the simulation. Error estimates are given where known. (Author)

A79-38886 The dynamics of a general aviation pilot promotion campaign. M A Duffy (Battelle Columbus Laboratories, Columbus, Ohio) In Annual Simulation Symposium, 11th, Tampa, Fla., March 15-17, 1978, Record of Proceedings.

Tampa, Fla., Annual Simulation Symposium, Long Beach, Calif., IEEE Computer Society, 1978, p. 305-317.

A dynamic simulation model has been developed to model causal connections between the supply of general aviation pilots, aircraft demand, and aircraft utilization. Previous applications of the simulation model have included an assessment of the impact on general aviation activity of regulatory changes that would bring about increases in user costs. In this paper, the impact of the program initiated by the General Aviation Manufacturers' Association (GAMA) to double the private pilot population by 1980 is studied. According to the simulation model, if the GAMA program is successful there will be approximately 50,000 additional active general aviation aircraft by 1985. J M B

A79-38906 # A method for the calculation of 3D boundary layers on practical wing configurations. J P F Lindhout, G Moek, E De Boer, B Van Den Berg (National Lucht en Ruimtevaartlaboratorium, Amsterdam, Netherlands) In Turbulent boundary layers. Forced, incompressible, non-reacting, Proceedings of the Joint Applied Mechanics, Fluids Engineering and Bioengineering Conference, Niagara Falls, N.Y., June 18-20, 1979. New York, American Society of Mechanical Engineers, 1979, p. 35-46. 13 refs.

The paper describes a method for calculating three-dimensional turbulent and laminar boundary layers on nondevelopable surfaces. A simple eddy viscosity model is incorporated in the method and consideration is given to the organization of computations with the aim of circumventing as much as possible stepsize limitations. As an example, the method is applied to laminar boundary layer flow over a flat plate with attached cylinder and to turbulent boundary layer flow over an aircraft wing. B J

A79-38943 Experimental data on the dynamic properties of several propeller vanes. W A A Monna and A G M Driedonks (Koninklijk Nederlands Meteorologisch Instituut, De Bilt, Netherlands) *Journal of Applied Meteorology*, vol. 18, May 1979, p. 699-702. 8 refs.

The dynamic properties of three types of commercially available propeller vanes were investigated in a wind tunnel. The same was done for the cup anemometer and wind vane as used on the 200-m mast at Cabauw, the Netherlands, as well as for the tri-vane, used for three-dimensional turbulence measurements. For these instruments the distance constant, damping ratio and damped wavelength were determined as well as the propeller response to a constant air speed as a function of the yaw angle. The results show differences from the manufacturer's specifications. Compared with the other instruments, the tri-vane appeared to be about twice as fast in response to

variations of the wind vector. Among the other instruments there were no large differences. (Author)

A79-38951 # Damage-tolerant fan blade design. L Cernoch and H Kaehler (Avco Corp., Avco Lycoming Stratford Div., Stratford, Conn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1119*. 11 p. 11 refs.

A method of predicting the extent of local damage to fan blades resulting from bird ingestion was evolved and used in the development of the ALF 502 turbofan engine. Projectile and target parameters were related to the impact conditions producing damage to fan blades, acceptable damage levels were determined by full-scale engine ingestion tests to ensure survivability in a damaged state. Engine survivability under different ingestion conditions or with different blade designs was then predicted by application of the damage criterion (Kaehler, 1977). C K D

A79-38952 # Propulsion system sensitivities for a strategic aircraft. R M Tyson (Rockwell International Corp., Los Angeles, Calif.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1121*. 6 p.

A study was conducted to identify advanced engine technologies which would have high payoffs for new strategic aircraft. Technology candidates were assessed and their performance advantages identified using propulsion system performance sensitivities to component changes and vehicle takeoff gross weight sensitivities to propulsion system performance and weight changes. The propulsion technologies with the highest potential for reducing strategic aircraft weight are those which allow reduced turbine cooling flow and those which increase takeoff specific thrust. (Author)

A79-38953 # The multiple application core engine - Sizing and usage criteria. E A Lehmann (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1123*. 9 p.

Sizing and usage criteria for an advanced technology engine core (high pressure rotor) for multiple application in a variety of aircraft types are discussed. The multiple application core engine (MACE) considered consists of a high pressure compressor, combustor, and high pressure turbine designed for the composite fighter/bomber duty cycle. Data packages for a family of six study engines derived from a common core having a base corrected compressor exit flow of about 5.6 lb/sec, scalable to 150%, were compared with optimum engine parameters for several advanced airframe types currently under study to determine what applications could be grouped with a single core size and what penalties in take-off gross weight or other mission parameters are necessary to accommodate core commonality. Take-off gross weight appeared to be relatively insensitive to core size over a wide size range if the bypass ratio was varied to maintain the thrust requirement. C K D

A79-38961 * # Evaluation of methods for prediction of propulsion system drag. G D Kuhn, O J McMillan, S C Perkins, Jr (Nielsen Engineering and Research, Inc., Mountain View, Calif.), and E W Perkins. *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1148*. 13 p. 40 refs. Contract No. NAS2 9513.

The results of a study directed toward compilation of a theoretical and experimental data base covering inlet/airframe and nozzle/afterbody integration are described, with the major emphasis on the evaluation of the adequacy for preliminary design purposes of the data base for afterbody/propulsion system interference effects. Prediction methods that exist for afterbody/airframe interference effects are evaluated with respect to the requirements of breadth, ease of application and accuracy that are important for preliminary design. (Author)

A79-38962 * # The selection of materials technologies for full-scale development G A Aronstamm (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, Conn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1152* 8 p
NASA-sponsored research

Candidate material technologies offering the largest application payoff for the least development costs and the least risk should be selected for full-scale development funding. A cost/benefit methodology is developed to rate candidate material and process opportunities for future aircraft engine applications. A development cost estimate and risk analysis is compared with the economic benefit to establish a ranking of the candidate advanced technologies. Also included are examples of this methodology as applied to high-strength HIP turbine disks, advanced oxide dispersion strengthened burner liners, and ceramic first-stage high-pressure turbine vanes. S D

A79-38963 # Cost benefits from improved hot section life prediction technology A J Dennis and T A Cruse (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, Conn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1154* 9 p

Aircraft operating costs can be significantly reduced by increasing the life of engine hot section parts, the hot section consisting of the combustor and turbine. Improvements in hot section technology are essential to meet the combined need for higher performance and greater durability. The paper deals with improved analytical methods to predict hot section component lives more accurately, thus ensuring reduced aircraft operating costs. Hot section component life prediction uses nonlinear stress-strain analysis which requires improved time-dependent plasticity material models. The improved creep/fatigue life exhaustion model should be sensitive to actual mission usage. Verification and demonstration of these methods aim at establishing confidence for application to hardware design. Attention is given to structures technology for improved combustor liner creep/fatigue life. S D

A79-38964 * # General aviation turbine engine /GATE/ concepts E J Lays and D L Murray (Williams Research Corp., Wall Lake, Mich.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1157* 14 p
NASA sponsored research

The paper deals with only a portion of the work done by Williams Research Corporation for NASA. It provides a look at possible new-generation powerplants that offer the potential for remarkable airplane performance gains with attendant safety, utility, productivity and life cycle cost benefits. Attention is given to a turboprop engine concept and applications. A turbofan engine having core components in common with the turboprop is also discussed and an airplane application shown. Some of the more important findings are presented. S D

A79-38965 # A novel correlation of centrifugal compressor performance for off-design prediction D P Kenny (Pratt and Whitney Aircraft of Canada, Ltd., Longueuil, Quebec, Canada) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1159* 7 p

A method is proposed for generalizing the performance of centrifugal compressor impellers and diffusers with two simple correlations for each element. These are based upon throat blockage as a function of leading edge incidence and static pressure effectiveness (measured from the throat) as a function of throat blockage. Such correlations have been known for some time to provide unique relationships for diffusers. It has now been found that this is also true for impellers. These four generalized correlations then provide a simple means of predicting the off-design performance of centrifugal compressor stages. This is particularly applicable in defining the effect of changes in diffuser throat area or impeller diffusion and throat area. The method even lends itself to optimizing the overall geometry of a given centrifugal stage. (Author)

A79-38966 # Turbo-fan design for general aviation - The evolution of the RB 401 G M Lewis (Rolls-Royce, Ltd., Aero Div., Bristol, England) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1160* 11 p

The paper discusses the engineering and design aspects of the evolution of the business jet aircraft gas turbine engine RB 401 as a candidate engine for the general aviation market. The discussion covers market requirement, cycle choice, technology base and engine configuration, initial project design, demonstrator engine test results, basis for redesign and some design features of RB 401-07 engine, RB 401-07 test results, and application of the RB 401. The results obtained from engine tests establish the RB 401-07 as a suitable candidate powerplant in the growing field of business jet aviation. S D

A79-38967 # Evaluation of an ejector-powered engine simulator at transonic Mach numbers C E Robinson, G D Smith, and R J Matz (ARO, Inc., Arnold Air Force Station, Tenn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1165* 7 p

An experimental program was conducted in the AEDC Propulsion Wind Tunnel (16T) to evaluate an air-driven ejector for use as an airbreathing engine simulator. The simulator was installed in the right nacelle of a 0.06-scale B-1 model. The data obtained during this investigation are compared with data obtained using conventional testing techniques and with limited flight data. The comparisons demonstrate that the concept of using an ejector-powered engine simulator is valid. More extensive studies to document the capability of the simulator throughout the performance envelope of a typical aircraft should be conducted. (Author)

A79-38968 # A parametric study of support system interference effects on nozzle/afterbody throttle dependent drag in wind tunnel testing C S Finnerty (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, Ohio) and E A Price, Jr (ARO, Inc., Arnold Air Force Station, Tenn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1168* 14 p 10 refs

A series of wind tunnel tests were conducted in the Arnold Engineering Development Center 16 foot transonic wind tunnel. These test results utilized an 11% F 16 nozzle/afterbody model. During the test, Mach number, Reynolds number, angle-of-attack, nozzle pressure ratio, and horizontal tail deflection were varied as well as support system geometry. The paper presents the support system interference effects resulting from the variations in the strut, wing-tip, and sting support systems. Support system variations include wing-tip support blade position, support boom diameter, length, spacing, and sting taper location. In general, the results presented indicate that the sting support with annular jet is the most interference free support system as compared to both the wing tip and strut support systems. (Author)

A79-38969 * # Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface D M Straight (NASA, Lewis Research Center, Cleveland, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1170* 13 p 17 refs

Cooling is one of the critical technologies for efficient design of exhaust nozzles, especially for the developing technology of non-axisymmetric (2D) nozzles for future aircraft applications. Several promising 2D nozzle designs have external expansion surfaces which need to be cooled. Engine data are scarce, however, on nozzle cooling effectiveness in the supersonic flow environment (with shocks) that exists along external expansion surfaces. This paper will present experimental film cooling data obtained during exploratory testing with an axisymmetric plug nozzle having external expansion and installed on an afterburning turbojet engine in an altitude test facility. The data obtained shows that the shocks and local hot gas

stream conditions have a marked effect on film cooling effectiveness. An existing film cooling correlation is adequate at some operating conditions but inadequate at other conditions such as in separated flow regions resulting from shock boundary-layer interactions

A79-38974 * # Investigation of a laser Doppler velocimeter system to measure the flow field of a large scale V/STOL aircraft in ground effect A D Zalay, M R Brashears, A J Jordan, K R Shridner, and C D Vought (Lockheed Missiles and Space Co., Inc., Huntsville, Ala.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1184* 8 p 10 refs NASA-sponsored research

An experimental research program for measuring the flow field around a 70 percent scale V/STOL aircraft model in ground effect is described. The velocity measurements were conducted with a ground-based laser Doppler velocimeter at an outdoor test pad. The remote sensing instrumentation, experimental tests, and results of the velocity surveys are discussed. The distribution of vertical velocity in the fan jet and fountain, the radial velocity in the wall jet and the horizontal velocity along the aircraft underside are presented for different engine rpms and aircraft heights above ground. The study shows that it is feasible to use a mobile laser Doppler velocimeter to measure the flow field generated by a large scale V/STOL aircraft operating in ground effect

A79-38975 # Infrared signature measurement techniques and simulation methods for aircraft survivability G E Varney (General Electric Co., Aircraft Engine Group, Cincinnati, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1186* 10 p

This paper discusses the methodology of relating infrared signatures of aircraft weapon systems to their survivability in a combat situation. Techniques to measure the infrared radiation signatures for gas turbine engines are presented for outdoor static test and wind tunnel model testing. Infrared measurement instrumentation and data analysis methods are given that characterize the band total, spectral and spatial distribution. Techniques for estimating the in-flight aircraft signatures are also presented. Use of these in-flight signatures in air combat simulator for estimating aircraft combat survivability are then discussed

A79-38976 # Damage tolerant design - An approach to reducing the life cycle cost of gas turbine engine disks C E Meece and C E Spaeth (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1189* 6 p USAF-supported research

The rupture of a disk in a gas turbine engine, although it is a rare occurrence, invariably requires engine shutdown and frequently results in extensive damage to the engine. For this reason disks are designed to be the most reliable parts in the rotating structure. This emphasis on reliability coupled with typical variations in material properties, engine operating characteristics, and manufacturing tolerances has resulted in the retirement of most disks from service before their total useful lives are depleted. Current disk lives are established so that at the end of the calculated lifetime one disk in one thousand will develop a very small crack at the limiting location. The life prediction method employs classical damage summation techniques to deal with mission complexities and identifies for the disk population a life at which disks must be removed to ensure safe operation

(Author)

A79-38977 * # The strainrange partitioning behavior of an advanced gas turbine disk alloy, AF2-1DA G R Halford and A J Nachtigall (NASA, Lewis Research Center, Cleveland, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1192* 10 p 14 refs

The low-cycle, creep-fatigue characteristics of the advanced gas turbine disk alloy, AF2-1DA have been determined at 1400 F and are presented in terms of the method of strainrange partitioning (SRP). The mean stresses which develop in the PC (tensile Plasticity reversed by compressive Creep) and CP (tensile Creep reversed by compressive Plasticity) type SRP cycles at the lowest inelastic strainrange are observed to influence the cyclic lives to a greater extent than the creep effects and hence interfered with a conventional interpretation of the results by SRP. A procedure is proposed for dealing with the mean stress effects on life which is compatible with SRP

(Author)

A79-38978 # Aircraft engine design using experimental stress analysis techniques B L Koff (General Electric Co., Aircraft Engine Group, Cincinnati, Ohio) (NATO, AGARD, Symposium on Stresses, Vibrations, Structural Integration and Engine Integrity, Cleveland, Ohio, Oct 23-27 1978) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1193* 12 p

Experimental analyses are used more extensively in aircraft engine design today than ever before, primarily because of the demands for extended component life. The paper is a perspective of prominent experimental techniques used in current aircraft engine stress analyses. It addresses the verification of temperature, stress, steady state and dynamic deformation, pressure, and fatigue strength by employing advancements in instrumentation, including high-energy X-rays and high durability strain gages, computers and software to reduce vast amounts of data, increased photoelastic capabilities, and advancements for reproducing loading and environmental conditions in laboratory component tests. These experimental techniques and disciplines have continued to advance in both capability and importance, and the state of the art in structural engineering would be significantly reduced without them

(Author)

A79-38979 # Development of a gas turbine combustor dilution zone design analysis A S Novick, J R Arvin, and R E Quinn (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, Ind.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1194* 11 p 13 refs

Recent advancements in developing an analytical technique applicable to gas turbine combustion design problems are presented. A complex 3-D mathematical model computes the trajectories of a system of dilution jets within a combustor dilution zone and transition section. The jet velocity centerline trajectories are obtained as the solution of an approximate differential equation. Boundary and initial conditions are factored into the solution in a natural manner, consequently, the interactions of jets with each other and confining walls are included. The analytical simulation and solution technique are detailed due to uniqueness of modeling the multi-jet trajectories and interactions in a confined environment. Comparisons of the analytical predictions with available experimental data are shown. Results illustrating practical combustor flow problems show that significant progress has been made toward the realization of a useful design capability

A79-38980 * # Analysis of the impact of the use of broad specification fuels on combustors for commercial aircraft gas turbine engines E J Szelata (United Technologies Research Center, East Hartford, Conn.), R P Lehmann (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, Conn.), and A L Smith (NASA, Lewis Research Center, Cleveland, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1195* 11 p 16 refs

An analytical study was conducted to assess the impact of the use of broad specification fuels with reduced hydrogen content on the design, performance, durability, emissions and operational characteristics of combustors for commercial aircraft gas turbine

engines. The study was directed at defining necessary design revisions to combustors designed for use of Jet A when such are operated on ERBS (Experimental Referee Broad Specification Fuel) which has a nominal hydrogen content of 12.8 percent as opposed to 13.7 percent in current Jet A. The results indicate that improvements in combustor liner cooling, and/or materials, and methods of fuel atomization will be required if the hydrogen content of aircraft gas turbine fuel is decreased (Author)

A79-38981 * # Test verification of a turbofan partial swirl afterburner. K. J. Hanloser (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) and R. Cullom (NASA, Lewis Research Center, Cleveland, Ohio). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1199* 6 p. 6 refs.

Flamespreading velocities exceeding conventional turbulent flamespreading values were demonstrated in a strong centrifugal flow field. This centrifugal flow field flamespreading concept was integrated into an F100 turbofan engine afterburner by introducing swirling airflow into the afterburner. Successful tests were conducted on F100 Engine P072 at sea level and at altitude conditions in a test chamber. This paper summarizes the design approach, engine design verification tests and performance data. Engine tests showed the swirl afterburner increased fuel-air capability improving combustion stability at adverse conditions for combustion in the engine flight envelope. No engine performance or durability degradation was observed (Author)

A79-38982 # A European view on gas turbine engine monitoring of present and future civil aircraft. S. G. Danielsson (Scandinavian Airlines System, Stockholm, Sweden) and G. Dienger (Lufthansa, Hamburg, West Germany). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1200* 9 p. 7 refs.

The engine condition monitoring (ECM) approaches currently in use for wide bodied aircraft by SAS and Lufthansa are compared. Technical requirements for expanded ECM systems planned for introduction with the AIRBUS A310 (Lufthansa) and the AIRBUS A300B4 (SAS) are outlined. The new systems will incorporate an engine module condition monitoring system which will allow assessment of actual module performance deterioration and degree of restoration required. Expanded engine instrumentation and ADS type data acquisition and recording equipment on board the aircraft will be required. The software for ground-based data processing will feature engine module performance analysis, trending logic for engine and module parameters, combination of trend data with other ECM relevant information (maintenance actions, crew reports, engine history including test cell data), automatic flagging of suspicious units, and real time processing. C. K. D.

A79-38983 # Fault-tolerant, high reliability electronic engine control system. V. G. Mosca, C. Rabinowitz, and H. Kremer (United Technologies Corp., Electronic Systems Dept., Windsor Locks, Conn.). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1202* 9 p. 9 refs. Contract No. F33615-77-C-2055.

The paper introduces and applies the principles of redundancy management techniques to the design of highly reliable fault-tolerant electronic engine controls. The evaluation starts with a baseline electronic final control system design. The baseline system is then altered to evaluate the benefit of successive applications of redundancy management techniques such as selective triple redundancy, majority voting, fault coverage, built-in test, and reliability mathematical modeling methods. These trends and methods used in fly-by-wire system reliability are evaluated for applicability to fuel controls. An optimum mix of MTBP, safety, and hardware complexity can be achieved through application of selected dual and triple redundancy at the functional modular level with a high-degree of software cross-strapping. S. D.

A79-38984 * # Application of digital controls on the quiet clean short haul experimental engines. A. A. Saunders, Jr. (General Electric Co., Aircraft Engine Group, Cincinnati, Ohio) and A. C. Hoffman (NASA, Lewis Research Center, Cleveland, Ohio). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1203* 8 p. 6 refs. Contract No. NAS3-18021.

The digital control systems for the Under-the-Wing (UTW) and Over-the-Wing (OTW) engines developed on the NASA/General Electric Quiet Clean Shorthaul Experimental Engine (QCSEE) program are described. The system to control engine variables includes three major functional parts: system sensors, digital control and system actuators. One of the primary control system functions is to prevent the engine from exceeding speed or temperature limits. The UTW control system also provides fault detection and condition monitoring. The control system requirements for the OTW engine are essentially the same as the UTW engine, however the inlet Mach number control requirement is eliminated, and failure indication and corrective action and full authority digital control are added. The digital controls scheduled the engine variables and maintained engine operation within all physical limits throughout the test program of approximately 200 hours of operation and provided stable and accurate control of both engines. V. T.

A79-38991 # The application of rapid solidification rate superalloys to radial wafer turbine blades. D. B. George, B. T. Brown, and A. R. Cox (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1226* 9 p. 6 refs. Contract No. N00019-76-C-0552. ARPA Order 3152.

The implementation of rapid-solidification rate (RSR) powder process alloy technology is expected to provide significant improvements in future advanced gas turbine engines. The paper describes separately the technologies of RSR powder process materials and wafer cooling. The synergistic combination of these two technologies is then reviewed in conjunction with a development plan devised to implement this technology in engines of the future. It is shown that the high-temperature capabilities of radial wafer blades fabricated from the RSR powder process material makes them well suited to an advanced engine design. S. D.

A79-38992 # Partially variable area turbine nozzle. R. H. Andersen and R. C. Haubert (General Electric Co., Evendale, Ohio). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1227* 9 p. Research supported by the General Electric Co., Contracts No. F33657-76-C-0213, No. F33657-72-C-0206.

The concept of the partially variable turbine nozzle is described, with special emphasis on design evaluation. The evaluation program is discussed relative to air turbine rig tests, turbine blade stress effects and Fourier analysis, and engine testing. For structural reasons, the partially variable turbine nozzle is a segmented design where three-vane sectors containing one variable vane each are used together with fixed two-vane sectors which fill out the nozzle. It is shown that the partially variable turbine nozzle concept exhibits superior performance to the fully variable design because of reduced end-wall leakage. S. D.

A79-38993 # Engine demonstration test of a cooled laminated axial turbine. R. W. Vershure, Jr. (AirResearch Manufacturing Company of Arizona, Phoenix, Ariz.). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1229* 8 p. Contract No. F33615-76-C-2176.

The first successful engine demonstration test of a cooled laminated axial turbine rotor is described. A small integral turbine rotor was constructed with a unique fabrication method - the laminate process - which uses precision photoetched laminates bonded together to form a complete rotor. The results of the rotor

component tests which led up to the engine test are discussed. These component tests included material property data, NDE, overspeed, airflow, and blade vibration testing. A 20 hour engine test was then conducted which demonstrated the mechanical integrity of a laminated turbine rotor. Using an advanced optical pyrometer system, repeatable blade-to-blade metal temperatures were recorded. A close correlation was achieved between the measured blade cooling effectiveness and the predicted cooling effectiveness, 0.52 and 0.53 respectively. This demonstration test showed that a very high heat-transfer performance is possible in small turbine engines using the laminate process. (Author)

A79-38994 # The monorotor gas turbine. C. Rodgers. *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1230*. 10 p. 6 refs.

A monorotor gas turbine demonstrated both performance and endurance in a modified auxiliary power unit. This unit featured a single-stage radial compressor and turbine integrated back-to-back in a single casting. Continuing development of the monorotor concept shows that, in addition to offering moderately high turbine inlet temperature capability without sophisticated internal air cooling, both manufacturing and life cycle costs can be significantly decreased. This is a consequence of the extremely simple engine powerhead configuration which comprises the monorotor and integral shaft forming a single-mass, highly stable rotor assembly, single-piece compressor diffuser, turbine nozzle monostator assembly, inlet housing, and axial reverse flow combustor. A second candidate aircraft application of the monorotor gas turbine concept appears to be in small, expendable, low cost, remote, pilotless vehicles. This paper describes the development of a small monorotor gas turbine and examines its potential for increased cost savings both in manufacturing and operation. (Author)

A79-38995 # The role of three-dimensional flow analysis in the design of turbomachinery. K. D. Mach (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, Ohio). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1231*. 5 p. 12 refs.

The flow fields in turbomachinery, particularly in the turbines of gas turbine engines, are known to be the most complex. The paper examines the current status of three-dimensional flow analysis as applied to turbomachinery. Some typical results of a pertinent algorithm are presented. The computational environment is much less restrictive than in the past, and computer results are almost always quicker to obtain than test results. The probable course of future developments and their impact on the design of turbomachinery are discussed. Combined numerical and experimental investigations of flow fields are recommended, with three-dimensional flow analysis to become an everyday design tool and a partial substitute for testing. S. D.

A79-38996 # Factors influencing nacelle design on the 747. M. I. K. MacKinnon and B. K. Mehta (Boeing Commercial Airplane Co., Seattle, Wash.). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1236*. 9 p. 7 refs.

The paper briefly reviews the factors that have influenced nacelle design on the 747 airplane. Currently available power plant installations for General Electric, Pratt and Whitney and Rolls-Royce engines are examined and compared. Performance improvements for these existing nacelle types are discussed. The possibilities for future nacelle developments on the 747 are outlined, including the use of power plant packages being developed for new airplanes, and advanced nacelle concepts such as long duct forced mixer nozzles and structurally integrated nacelles. (Author)

A79-38997 # Ignition of liquid fuel jets in a supersonic air stream. J. A. Schetz, S. C. Cannon (Virginia Polytechnic Institute and State University, Blacksburg, Va.), and S. Baranovsky. *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1238*. 11 p. 15 refs.

Water, kerosene and carbon disulfide were injected both transverse (90 deg) and oblique-upstream (45 deg) with respect to a hot supersonic ($M = 1.65$) vitiated air flow at various stagnation temperatures and injection pressures (and hence flow rates and momentum ratios). Attention is given to the behavior of the liquid fuel layer that had previously been found to form on the surface near the injector. Results of wall and in-stream temperature measurements and photographic records in both the visible and infrared wavelength spectra are discussed. For transverse injection at air temperatures up to 2260 F, little evidence of combustion is found for either kerosene or CS₂, and the liquid layer is not expected to change radically in character with change in temperature. For the oblique-stream injection, ignition occurred for CS₂ at stagnation temperatures not less than 2030 F and possibly for kerosene. S. D.

A79-39010 # Project Sunrise. R. J. Boucher (Astro Flight, Inc., Venice, Calif.). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1264*. 6 p. ARPA USAF sponsored research.

The solar powered aircraft Sunrise is described, with special emphasis on the flight demonstration program, design features of the Sunrise air vehicle, aerodynamic configuration, airframe, solar power subsystem, propulsion subsystem, and flight envelope. Calculated and measured performance are given. The Sunrise Program demonstrated the feasibility of solar-powered flight. Ways of harnessing the unique behavior and attributes of these solar-powered vehicles are now being explored. S. D.

A79-39011 # Electric propulsion for high performance light aircraft. A. D. Galbraith (Continental Group, Inc., Palo Alto, Calif.). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1265*. 10 p.

An actual design example is presented for application to a representative light aircraft on the basis that its performance must match that of the gasoline engine drive train which is replaced. Attention is given to concept description and analysis, derivation of requirements and design layout, lithium-aqueous electrolyte fuel cell, lithium recycling, metallic lithium as a fuel, propulsion motor and associated controls, and growth potential of the technology. It is shown that a representative high-performance single engine airplane can be powered by an electric drive train which produces power, duration, and weight equal or comparable to a gasoline powerplant, utilizing current state-of-the-art devices. The resulting performance of the electric powered aircraft is comparable to turboprop aircraft and is independent of atmospheric air density, with the consequent advantages of high-altitude operation, speed, range, and weather avoidance. S. D.

A79-39012 # Small hole drilling and inspection with pulsed laser systems. A. U. Jollis (General Electric Co., Aircraft Engine Business Group, Cincinnati, Ohio). *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1268*. 7 p.

Advances in laser technology are described which have led to the development of methods and equipment for drilling and inspecting small holes in air-cooled aircraft engine structures. These structures are made from high temperature alloys and incorporate cooling circuits which are comprised of small holes with large depth-to-diameter ratios. The drill technique discussed in this paper utilizes solid state lasers while a scanning Helium/Neon laser beam is employed to inspect the holes between drill cycles. The laser devices are combined with numerically controlled positioning tables and other auxiliary equipment to form automated laser drill and inspection machines for production application. Process capabilities and equipment construction are reviewed and examples of drill operation are given. (Author)

A79-39013 # Advanced forging process for gas turbine engine fan blades C R Cook (TRW, Inc, Cleveland, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1269* 5 p 5 refs Contract No F33615-77-C-5002

Titanium 8Al-1Mo-1V alloy fan blades for the F100 engine have been precision forged using the isothermal forging process. Forgings have been produced with dies operating at 1750 deg plus or minus 20 F. The IN100 alloy forging dies accomplished 595 pressing operations without damage to the airfoil surfaces. Form and thickness control of the blades was maintained well below tolerances required. Metallurgical characteristics of the forgings were entirely acceptable. Reduced material requirements and less machining for finishing result in lower manufacturing costs. Blades are being evaluated for engine qualification. (Author)

A79-39017 # Methodology for prediction of V/STOL propulsion induced forces in ground effect W H Foley (General Dynamics Corp, Aerospace Technology Dept, Fort Worth, Tex) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1281* 8 p 15 refs Navy-sponsored research

The paper presents the development of an empirical method to calculate the pure suckdown component of the forces acting on the planform of a hovering V/STOL aircraft. The point of departure for the predictive methodology is the work of Karemaa et al (1973, 1978) wherein the net-induced force upon a planform is divided into three parts. While examination of the diagrams for the effect of eddy size on suckdown and the effect of nozzle pressure ratio on suckdown indicates that turbulence can cause changes in suckdown on the order of 20%, it must be recognized that the net force also includes fountain buoyancy, which can be of the same order as suckdown but of opposite sign. Thus, net force is determined as the difference between two relatively large numbers. In this context, a second-order change in either of these numbers can result in a first-order change in aircraft performance. It remains to work out a methodology for the prediction of fountain buoyancy and of the interference between the fountain and suckdown. S D

A79-39018 # The impact of operational requirements on V/STOL propulsion concept selection W R Boruff and A J Roch, Jr (Vought Corp, Dallas, Tex) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1283* 9 p 10 refs

In recent years a wide variety of V/STOL propulsion concepts have been advanced as ways to perform vertical takeoff and landing. This paper presents results of a recent Vought study that examines four supersonic V/STOL propulsion concepts. Aircraft sized to common design criteria and missions are compared for three lift/cruise concepts and one lift plus lift/cruise concept. Both fighter escort and deck launched intercept mission requirements are considered. Sizing constraints include acceleration capability, sustained load factor, ceiling, maximum speed, specific excess power, vertical takeoff thrust to weight, and engine-out thrust-to-weight. Results emphasize the importance of well founded operational requirements. An engine-out vertical landing requirement is shown to be an important design driver. Each propulsion system concept is sized by a different combination of mission and performance constraints, and each concept demonstrates a different sensitivity to variations in these requirements. (Author)

A79-39019 # V/STOL aircraft configuration effects on exhaust gas ingestion E D Spong, J H Kamman, C L Hall, and E T Seiffert (McDonnell Aircraft Co, St Louis, Mo) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1284* 8 p 7 refs

A test program was conducted to investigate thermal flowfield properties and inlet system ingestion characteristics for three- and four-nozzle V/STOL aircraft configurations, utilizing a planform

model. The results indicate strong configuration effects on ingestion and the necessity for careful nozzle simulation. Potential methods of reducing ingestion are identified, which can be applied either in the design stage through optimum configuration arrangement or subsequent to configuration selection through shielding devices. It is further demonstrated that thermal flowfield data acquired in the free jet, fountain and stagnation upwash regions can be used to understand the ingestion characteristics. (Author)

A79-39020 * # Static test of a large scale swivel nozzle thrust deflector J F Federspiel (Rockwell International Corp, Columbus, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1285* 9 p 6 refs NASA supported research

Experimental results from a swivel nozzle thrust deflector test program are presented. The deflector was installed behind a 36-inch fan with a tip turbine hot gas drive. The maximum nozzle pressure ratio was 1.2. Nozzle thrust and flow coefficients are presented for a range of vectoring angles. The results are also compared to small scale cold flow test results. The comparison suggests a need for accurate simulation of nozzle entry pressure and temperature profiles on model tests. (Author)

A79-39027 # Evaluation of ground-launch firings for the improved 2.75-inch rocket D M Bergbauer, J H Ferguson (US Naval Ordnance Station, Indian Head, Md), R W Bergman (US Army, Missile Research and Development Command, Redstone Arsenal, Ala), and R Bentley (Veda, Inc, Arlington, Va) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1297* 9 p

An improved 2.75-inch rocket, the Mk 66 Mod O, was developed by the Navy in the early 1970s. Test results are presented for ground-launch firings of various modified designs. Because of the variety and large amount of test data, summary information is presented. For illustration, some specific data that are representative of rocket performance are included: impact dispersion, spin rates, and burnout velocities. Results indicate improved dispersion with increased roll rate at launcher separation. Future plans for continued evaluation are briefly outlined. S D

A79-39031 * # Combined pressure and temperature distortion effects on internal flow of a turbobfan engine W M Braithwaite and R H Soeder (NASA, Lewis Research Center, Cleveland, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev, June 18-20, 1979, AIAA Paper 79-1309* 11 p 13 refs

The flow characteristics obtained experimentally for the compression of a 2-spool TF30-P-3 turbobfan engine operating with 180 grad combined pressure and temperature distortion in the inlet flow are presented. The analytical model (Mazzawy and Banks, 1976), 'tuned' during Lewis testing, was used for pretest predictions of the effects that these distortions would have on the engine flow characteristics and the limiting distortion values. The effect of inlet flow distortion on the performance of the engine is discussed, including (1) the flow between a screen mounted in the inlet duct and the inlet guide vanes, (2) the flow through the compression system, and (3) the effects of the combined distortion and its orientation on the compressor stability limits. It is concluded that the model used in this program was capable of predicting the effects of total pressure, total temperature and combined total pressure-total temperature distortions in terms of flow profiles, inlet flow angles and attenuation of the distortions through the compressor system. It was also capable of predicting the trends of the limiting values experienced with various orientations of the combined distortions. V T

A79-39032 # What small turbine engine does the small helicopter need, or The road to hell is paved with good intentions E E Cohen (Hughes Helicopters, Culver City, Calif) *AIAA, SAE, and*

ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1314 7 p

It is argued that today's small turbine engines do not meet the requirements of small helicopters as well as does the turbocharged piston engine. It is suggested that in developing advanced turbine engines for small helicopters, engine weight (unless it reduces the weight of the fuel system plus fuel) should be subordinate to other design considerations such as reduced fuel consumption, improved altitude performance, improved environmental acceptability, and increased engine reliability and maintainability. The specific fuel requirements of small turbine and piston engines are compared, growth trends in demand for small rotocraft are presented. C K D

A79-39033 # Effect of maintenance plan and engine durability on helicopter propulsion system ownership cost C E Curry and A C Wei (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, Ind.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1317 6 p*

Relative cost of ownership trade-offs between modular and nonmodular engine maintenance plans were evaluated. The relative gain/loss of operational availability resulting from scheduled and unscheduled engine removals for various levels of engine maximum operating time were analyzed over a range of premature removal rates from 0.2 to 1.0 removals per thousand engine operating hours. Conclusions were drawn suggesting that helicopter operators could select an operating parameter set that would tend to minimize their engine-ownership costs, which were shown to be significant cost elements in their total helicopter ownership cost. (Author)

A79-39034 * # Lean, premixed, prevaporized combustion for aircraft gas turbine engines E J Mularz (NASA, Lewis Research Center, U.S. Army, Propulsion Laboratory, Cleveland, Ohio) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1318 13 p 24 refs*

The application of lean, premixed, prevaporized combustion to aircraft gas turbine engine systems can result in benefits in terms of superior combustion performance, improved combustor and turbine durability, and environmentally acceptable pollutant emissions. Lean, premixed, prevaporized combustion is particularly attractive for reducing the oxides of nitrogen emissions during high altitude cruise. The NASA Stratospheric Cruise Emission Reduction Program will evolve and demonstrate lean, premixed, prevaporized combustion technology for aircraft engines. This multiphased program is described. In addition, the various elements of the Fundamental Studies Phase of the program are reviewed, and results to date of many of these studies are summarized. (Author)

A79-39035 * # Lean stability augmentation for premixing, prevaporizing combustors J B McVey and J B Kennedy (United Technologies Research Center, East Hartford, Conn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1319 12 p 5 refs Contract No NAS3-20804*

An experimental program was conducted to investigate techniques for improving the lean combustion limits of premixing, prevaporizing combustors applicable to gas turbine engine main burners. Augmented flameholders employing recessed perforated plates, catalyzed tube bundles, and configurations in which pilot fuel was injected into the wakes of V-gutters or perforated plates were designed and tested. Stable operation of the piloted designs was achieved at equivalence ratios as low as 0.25, NO_x emissions of less than 1.0 g/kg at simulated turbine engine cruise conditions were obtained. A piloted perforated plate employing four percent pilot fuel flow produced the best performance while meeting severe NO_x constraints. (Author)

A79-39037 * # The effect of fuel sprays on emissions from a gas turbine combustor J A Nicholls, C W Kauffman, D G Pelaccio, D R Glass, and J F Driscoll (Michigan, University, Ann

Arbor, Mich.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1321 8 p 10 refs Grant No. NSG-3148*

A research gas turbine combustor which allows for independent control of drop size, fuel/air ratio, air inlet temperature, pressure, reference velocity, and residence time has been used to study the influence of fuel spray characteristics on primary zone emissions. Local concentrations of oxides of nitrogen, carbon monoxide and unburned hydrocarbons at various locations in the flow, local gas temperature, gas velocity, and the turbulence intensity (measured with laser velocimetry) are obtained. A comprehensive data analysis program to compute the local fuel/air ratio and the sum of the mole fractions of the species present confirms the validity of the emissions data. Increasing drop size is correlated with an increase in unburned hydrocarbons, while increasing residence time is associated with sharp decreases in hydrocarbons and carbon monoxide and an increase in oxides of nitrogen. J M B

A79-39038 * # Emission characteristics of a premix combustor fueled with a simulated partial-oxidation product gas R M Clayton (California Institute of Technology, Jet Propulsion Laboratory, Control and Energy Div., Pasadena, Calif.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1322 8 p 5 refs Contract No NAS7-100*

A two-stage gas turbine combustor concept employing a very fuel-rich partial oxidation stage is being explored for broadening the combustion margin between ultralow emissions and the lean stability limit. Combustion and emission results are presented for a series of experiments where a simulated partial oxidation product gas was used in a premix combustor operated with inlet air state conditions typical of cruise power for high-performance aviation engines (12 atm and 850 F). Ultralow NO_x, CO, and HC emissions and an extended lean burning limit were achieved simultaneously. (Author)

A79-39047 # The application of the Prop-Fan concept in preliminary design of a very advanced technology light twin /VATLIT '85/ F M W A Grosveld (Kansas, University, Lawrence, Kan.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1343 13 p 12 refs*

Design analysis for propeller and nacelle have been accomplished for application in preliminary design of a very advanced light twin engine airplane, using the uninstalled efficiency as a criterion. The project engine is based on a prediction of the performance of a turbo-engine which could fit in the Prop-Fan concept. The computerized procedure is based on the thermodynamic relations of the gas turbine and optimized for operations at high subsonic Mach number and at high altitude. Results are presented which indicate significant improvement in installed propeller efficiency and specific fuel consumption, at performance comparable to that of a jet airplane. (Author)

A79-39048 # A streamlined control system development process C H Borgmeyer (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1344 7 p*

The software development, the physical facilities and the engineering technology required for an advanced logic capability with full authority electronic control system in high reliability and performance multimission aircraft are described. The need for increased use of simulations, the application of system identification methodology to update simulations, and techniques for fault analysis and logic verification are discussed. It was found that the basic control design/development process can be improved by using multi-variable control techniques as a control mode design tool to quantify variable interactions, by expanding existing control logic technology into adaptive systems, redundancy management, and

fault accommodation, by upgrading the accuracy of existing simulations, developing an automated system identification procedures to review engine and rig data, and using a specific control development/integration facility to test complete or partial systems in open or closed loop. This approach will enhance mission reliability since fault detection and fail operational procedures can be developed and engine life management modes designed and test verified for the expected variations in engine performance and design margin. A T

A79-39059 # Analysis of an unsteady aerodynamic force on a blade due to nonuniform amplitude gusts K Ishihara (Kawasaki Heavy Industries, Ltd., Akashi, Japan) and M Funakawa (Okayama College of Science, Okayama, Japan) *JSME Bulletin*, vol 22, Apr 1979, p 529-536. 7 refs

Lift fluctuations of a cambered blade with angle of attack under periodic gusts with nonuniform amplitude were studied by using vortex theory under the assumption that the gust amplitude on an airfoil varies linearly. It was clarified that the nonuniformity of gust amplitude has a strong effect on fluctuating lift for small reduced frequency but does not for large reduced frequency. (Author)

A79-39070 Installation for studying fatigue strength of materials in acoustic loading V A Kuz'menko, Iu M Golovanov, and L E Matokhniuk (Akademii Nauk Ukrainskoi SSR, Institut Problem Prochnosti, Kiev, Ukrainian SSR) (*Problemy Prochnosti*, Sept 1978, p 103, 104) *Strength of Materials*, vol 10, no 9, May 1979, p 1098, 1099. Translation

During flight, aircraft skins are subjected to intense acoustic fields from engine noise, breaks in the air flow, etc. A facility was constructed to study the fatigue strength of aircraft structural materials and to determine the fatigue crack propagation velocity under acoustic loading. The facility consists of a high intensity sound source, an air siren capable of generating both sinusoidal and broadband sound. Photographs of siren noise spectra at constant and variable rotor speeds are presented. B J

A79-39071 Method of determining non-steady-state force characteristics and flywheel effect of turbine blades from the streamflow pattern A V Dunaev (*Problemy Prochnosti*, Sept 1978, p 105, 106) *Strength of Materials*, vol 10, no 9, May 1979, p 1100-1102. 5 refs. Translation

The paper describes the AD-3 facility, a closed water tunnel with a working-part cross section of 140 x 80 mm, a maximum flow speed of 10 m/sec, and a total tunnel capacity of 0.7 cu m. The facility has been developed for investigating load characteristics associated with unsteady flow past plane cascades of vibrating blades, taking into account inlet flow pulsations and flow viscosity (with and without flow separation). The facility permits simultaneous investigation of hydrodynamic damping and streamflow patterns in separated flow. B J

A79-39088 # Aeroelastic models for cryogenic wind tunnels A Gravelle (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) (*Symposium on Cryogenic Wind Tunnels, Southampton, England, Apr 3-5, 1979*) *ONERA, TP no 1979-39*, 1979. 6 p

The application of Mach and Froude similarity rules to cryogenic wind tunnel testing of aeroelastic models is examined. It is shown that when stagnation temperatures are low and can be varied over a wide range, it is possible to obtain reasonable values for static loads and Reynolds numbers with flutter models. The scaling of models of the Airbus A300B and the F1 fighter for testing in a S2 MA wind tunnel is discussed and compared with possible scalings of similar models for testing in a cryogenic facility. C K D

A79-39089 # Balance and sting design for cryogenic wind tunnels M Bazin and M Dubois (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) (*Symposium on Cryogenic Wind Tunnels, Southampton, England, Apr 3-5, 1979*) *ONERA, TP no 1979-40*, 1979. 9 p. 15 refs

The paper deals with the problem of allowing for thermodynamic effects in the design and construction of aerodynamic balances and supporting rods (stings) of models in cryogenic wind tunnels. The need for new solutions is demonstrated. Particular attention is given to the development of metals and insulating materials capable of sustaining stresses and thermal gradients at wind tunnel temperatures between 100 and 300 K. V P

A79-39090 # Method of assessment of the antistatic protection of aircraft J Taillet (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) (*Conference on Electrostatics, Oxford, England, Apr 17-20, 1979*) *ONERA, TP no 1979-41*, 1979. 16 p. 9 refs. Research sponsored by the Direction des Recherches, Etudes et Techniques and Avions Marcel-Dassault-Breguet Aviation.

The solutions proposed by ONERA to meet the requirements of a safe antistatic protection of aircraft are outlined. A procedure is presented for testing the vulnerability of a protected or unprotected aircraft to static charging, as well as for assessing the validity of the methods used for this protection. The performance of pertinent instruments is discussed. A practical application is treated in some detail. Careful application of the test procedure is expected to increase the reliability of navigation/communication subsystems in operational use. S D

A79-39092 # Contribution to the development of motor emission regulations (Contribution a la mise au point de la réglementation des émissions des moteurs) M Pianko (*Groupe Sectoriel Franco-Soviétique, Sous-Groupe Effets du Transport Aérien sur l'Environnement, Réunion, 2nd, Moscow, USSR, Apr 25-29, 1979*) *ONERA, TP no 1979-43*, 1979. 52 p. In French.

Methods used by the International Civil Aviation Organization to develop emissions standards for aircraft engines are discussed. Attention is given to the approach used to establish acceptable limits for gaseous pollutants (NOx, CO, HC) within the context of a commonly accessible level of technology and to the problem of verifying conformity of individual engines or of engine types. Two statistical hypotheses for certification tests are examined. The first requires that the average engine of a given type satisfy emission limits; the second requires that the vast majority (95 percent) of engines of a given type conform to emissions limits. The implications for verification procedures of the choice of one or the other of these hypotheses, the conditions of the choice of test specimens (random choice or selection), and the presence or absence of a known value for the average deviation from emissions standards are analyzed. C K D

A79-39093 # A study of the evolution of noise exposure under different hypotheses of regulation (Etude de l'évolution de l'exposition au bruit sous diverses hypothèses réglementaires) M Pianko (*Groupe Sectoriel Franco-Soviétique, Sous-Groupe Effets du Transport Aérien sur l'Environnement, Réunion, 2nd, Moscow, USSR, Apr 25-29, 1979*) *ONERA, TP no 1979-44*, 1979. 60 p. In French.

The evolution of noise exposure around a small (two runways of 3600 m) airport as a function of time between 1990 and 2000 has been analyzed for two different regulatory scenarios: the absence of any new noise regulations and progressive adaptation of aircraft types to a set of regulations given elsewhere. The evolution of a representative fleet of long-, medium-, and short-range carriers was considered. Noise curves for each aircraft at take-off and landing were calculated. C K D

A79-39094 # Broad-band ultrasonic transducers for non-destructive inspection of aeronautical components (Transducteurs ultrasonores à large bande pour le contrôle non destructif de pièces aéronautiques) J-F de Belleval (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, Compiègne Université de Technologie, Compiègne,

France) (NATO, AGARD, Meeting on Non-Destructive Inspection Methods for Propulsion Systems and Components, London, England and Milan, Italy, Apr 23-27, 1979) ONERA, TP no 1979-45, 1979 11 p 8 refs In French

The method generally used to increase the bandwidth of piezoelectric transducers used in ultrasonic non-destructive inspection of aeronautical components, based on damping of the piezoelectric wafer on its rear face, entails a significant loss of sensitivity. It is suggested that bandwidth could be increased and sensitivity improved by damping with a multilayer front face. A computer program has been developed to analyze the propagation of a wave through several layers of different thicknesses and optimize the impedance and thickness of layers composing the transducer. These results were confirmed by comparison with the responses measured for transducers having front faces composed of one or two layers.

C K D

A79-39095 # Experimental analysis methods for unsteady flows in turbomachines (Méthodes d'analyse expérimentale des écoulements instationnaires dans les turbomachines) R Languier (ONERA, Châtillon sous Bagneux, Hauts de Seine, France) (Association Technique Maritime et Aéronautique, Session, Paris, France, May 14-17, 1979) ONERA, TP no 1979 59, 1979 25 p 29 refs In French. Research supported by the Direction des Recherches, Etudes et Techniques.

Measurement methods are described for characterizing unsteady flows in turbomachines. They primarily concern the flow in a rotor, its wake, and boundary layers on stator or rotor blades. The measuring instruments are pressure sensors or short time pressure detectors, hot-wire probes or hot film gages, and laser velocimeters. For the flow aligned with the rotor, the analysis of pressure variations on the casing enables one to determine the shock wave configuration on supersonic compressor rotors, and to study the flow pattern in the presence of rotating separation. For the rotor wake, the results agree with measurements by ordinary pressure sensors connected to the rotor. The unsteady nature of the boundary layer on a stator or rotor blade is determined with hot wire probes or hot-film gages.

S D

A79-39096 # Estimation of compressible flows in turbomachines by an axisymmetric calculation method (Approche des écoulements compressibles dans les turbomachines par une méthode de calcul axisymétrique) R Sovrano and Y Ribaud (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) (Association Technique Maritime et Aéronautique, Session, Paris, France, May 14-17, 1979.) ONERA, TP no 1979-60, 1979 16 p 6 refs In French. Research supported by the Direction des Recherches, Etudes et Techniques.

A matrix inversion method which allows extension of the symmetric flow approximation widely used for perfect fluids in nearly axial flow turbomachines to non-axial turbomachines (principally centrifugal compressors) is presented. The proposed method can be used to analyze flow through turbomachines with widely varying geometries, and takes into account flow irreversibilities due to a possible off-design attack of the blades and friction losses in the blade channels. As long as the Mach number is less than unity during all iterations, computation time is short. The program converges rapidly even if local Mach numbers are greater than unity at a few points. Results obtained by application of the method to a centrifugal compressor with splitter vanes are presented.

A79-39500 Application of Laser Doppler Anemometry to aeroacoustic research J Haertig (Institut Franco-Allemand de Recherches, Saint-Louis, Haut-Rhin, France) In Dynamic measurements in unsteady flows, Proceedings of the Dynamic Flow Conference, Marseille, France, September 11-14, 1978 and Baltimore, Md, September 18-21, 1978. Skovlunde, Denmark, Proceedings of the Dynamic Flow Conference 1978, 1979, p 535-549 13 refs

Experiments performed by Institut Franco-Allemand de Recherches de Saint-Louis (ISL) in the framework of an investigation of jet noise were conducted on a cold jet at relatively high velocities which, without attaining those of real engine jets, are not very far below. The cold round free jet facilities of ISL and the Laser Doppler Anemometry (LDA) system are described. Consideration is given to causality correlation measurement with results agreeing with those obtained at lower jet exit velocities, and to the relation of velocity field coherence with sound radiated by a free jet. A large increase in coherence of the velocity field with higher excitation level was observed and it is noted that the convection velocity of these coherent structures is independent of the excitation. Attention is given to a resonance in transonic jets, concluding that the method used in the experiments gives reliable data without disturbing the flow or the acoustic fields.

A79-39602 * Satellite interferometer as an advanced navigation/communication system G S Gopalapillai, G T Ruck, and A G Mourad (Battelle Columbus Laboratories, Columbus, Ohio) *Navigation*, vol 25, Winter 1978-79, p 405-418 10 refs Contract No NASw-2800 NASA Task 3

An orthogonal system of interferometry baselines aboard a geostationary satellite is proposed to be used for navigation, surveillance, and traffic control. Position determination is based on the relationship between the measured phase differences, the known and unknown transmitter locations, and other systematic error model parameters using a generalized least squares estimation procedure. It is shown that position accuracy is critically dependent on the baseline length and on the magnitude of the random component of the measuring errors. Several trade-offs with respect to the system accuracies, the number of users, data rates, hardware costs, etc., are examined. Simultaneous use of the same channels for navigation and data transfer is found feasible and five candidate or 'strawman' interferometer system proposals are presented. It is concluded that the system's performance is excellent in comparison with present or planned systems, and that it is viable in meeting potential user's requirements.

A79-39751 # Vortex-induced oscillations - A selective review T Sarpkaya (US Naval Postgraduate School, Monterey, Calif) *ASME, Transactions, Journal of Applied Mechanics*, vol 46, June 1979, p 241-258 134 refs NSF-Navy-supported research

This paper reviews the vortex-induced oscillations in a few specific fundamental cases. Research topics discussed are vortex shedding from a stationary bluff body, consequences of the synchronization phenomenon, wake-oscillator models, added mass, damping, and dynamic response measurements, flow-field models and the discrete-vortex method, mechanism of synchronization, and, finally, in-line oscillations. Because of the selective nature of the review, a fairly comprehensive listing of recent contributions to the literature on these and related aspects of flow-induced oscillations research is an essential part of the exposition.

A79-39801 * # Tone noise of three supersonic helical tip speed propellers in a wind tunnel J H Dittmar, R J Jeracki, and B J Blaha (NASA, Lewis Research Center, Cleveland, Ohio) *Acoustical Society of America, Meeting, 97th, Cambridge, Mass., June 11-15, 1979, Paper 62* p 7 refs

Three eight bladed supersonic helical tip speed propellers were tested in the NASA Lewis Wind Tunnel at through flow Mach numbers of 0.6, 0.7, 0.75, 0.8, and 0.85. Such propellers are being considered as propulsors for a future energy conservative aircraft.

The three propellers of equal performance incorporate different plan forms and different amounts of sweep in order to investigate their noise generation, which could cause a cabin environment problem. The acoustically designed propeller SR-3 had 45 deg of tip sweep and was significantly quieter at Mach 0.8 cruise than the straight bladed propeller, SR-2. An intermediate 30 deg tip sweep propeller, SR 1m exhibited a noise level between the other two. Enhanced pressure-time traces indicated that SR-2 and SR 1m exhibited shock-like pressure traces at Mach-0.8 cruise while the SR-3 did not. Noise trends with varying helical tip Mach number and blade loading were also observed. M E P

A79-39802 * # Assessment at full scale of nozzle/wing geometry effects on OTW aeroacoustic characteristics. D Groesbeck and U von Glahn (NASA, Lewis Research Center, Cleveland, Ohio) *Acoustical Society of America, Meeting, 97th, Cambridge, Mass., June 11-15, 1979, Paper 29 p 5 refs*

The effects on acoustic characteristics of nozzle type and location on a wing for STOL engine over-the-wing configurations are assessed at full scale on the basis of model scale data. Three types of nozzle configurations are evaluated: a circular nozzle with external deflector mounted above the wing, a slot nozzle with external deflector mounted on the wing and a slot nozzle mounted on the wing. Nozzle exhaust plane locations with respect to the wing leading edge are varied from 10 to 46 percent chord (flaps retracted) with flap angles of 20 deg (take-off attitude) and 60 deg (approach attitude). Perceived noise levels (PNL) are calculated as a function of flyover distance at 152 m altitude. From these plots, static EPNL values, defined as flyover relative noise levels, are calculated and plotted as a function of lift and thrust ratios. From such plots the acoustic benefits attributable to variations in nozzle/deflector/wing geometry at full scale are assessed for equal aerodynamic performance. (Author)

A79-39803 * # An improved method for predicting the effects of flight on jet mixing noise. J R Stone (NASA, Lewis Research Center, Cleveland, Ohio) *Acoustical Society of America, Meeting, 97th, Cambridge, Mass., June 11-15, 1979, Paper 26 p 20 refs*

A method for predicting the effects of flight on jet mixing noise has been developed on the basis of the jet noise theory of Ffowcs-Williams (1963) and data derived from model-jet/free-jet simulated flight tests. Predicted and experimental values are compared for the J85 turbojet engine on the Bertin Aerotrain, the low-bypass refanned JT8D engine on a DC 9, and the high-bypass JT9D engine on a DC-10. Over the jet velocity range from 280 to 680 m/sec, the predictions show a standard deviation of 1.5 dB.

A79-39804 * # Materials and structural aspects of advanced gas-turbine helicopter engines. J C Freche (NASA, Lewis Research Center, Cleveland, Ohio) and J Acurio (US Army, Propulsion Laboratory, Cleveland, Ohio) *Association Aéronautique et Astronautique de France, International Congress in Aeronautics, Paris, France, June 6-8, 1979, Paper 63 p 122 refs*

Advances in materials, coatings, turbine cooling technology, structural and design concepts, and component life prediction of helicopter gas-turbine-engine components are presented. Stationary parts including the inlet particle separator, the front frame, rotor tip seals, vanes and combustors and rotating components - compressor blades, disks, and turbine blades - are discussed. Advanced composite materials are considered for the front frame and compressor blades, prealloyed powder superalloys will increase strength and reduce costs of disks, the oxide dispersion strengthened alloys will have 100C higher use temperature in combustors and vanes than conventional superalloys, ceramics will provide the highest use temperature of 1400C for stator vanes and 1370C for turbine blades, and directionally solidified eutectics will afford up to 50C temperature advantage at turbine blade operating conditions. Coatings for surface protection at higher surface temperatures and design trends in turbine cooling technology are discussed. New analytical methods of life prediction

such as strain gage partitioning for high temperature prediction, fatigue life, computerized prediction of oxidation resistance, and advanced techniques for estimating coating life are described. A T

A79-39805 * # Diagnostics of wear in aeronautical systems. L D Wedeven (NASA, Lewis Research Center, Cleveland, Ohio) *American Chemical Society, State-of-the-Art Symposium on Corrosion and Wear, 15th, Washington, D C, June 4-6, 1979, Paper 4 p 17 refs*

The use of appropriate diagnostic tools for aircraft oil wetted components is reviewed, noting that it can reduce direct operating costs through reduced unscheduled maintenance, particularly in helicopter engine and transmission systems where bearing failures are a significant cost factor. Engine and transmission wear modes are described, and diagnostic methods for oil and wet particle analysis, the spectrometric oil analysis program, chip detectors, ferrography, in-line oil monitor and radioactive isotope tagging are discussed, noting that they are effective over a limited range of particle sizes but complement each other if used in parallel. Fine filtration can potentially increase time between overhauls, but reduces the effectiveness of conventional oil monitoring techniques so that alternative diagnostic techniques must be used. It is concluded that the development of a diagnostic system should be parallel and integral with the development of a mechanical system. A T

A79-39814 * # Multivariable control altitude demonstration on the F100 turbofan engine. B Lehtinen (NASA, Lewis Research Center, Cleveland, Ohio), R L DeHoff (Systems Control, Inc., Palo Alto, Calif.), and R D Hackney (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1204 29 p 16 refs*

The control system designed under the Multivariable Control Synthesis (MVCS) program for the F100 turbofan engine is described. The MVCS program, applied the linear quadratic regulator (LQR) synthesis methods in the design of a multivariable engine control system to obtain enhanced performance from cross-coupled controls, maximum use of engine variable geometry, and a systematic design procedure that can be applied efficiently to new engine systems. Basic components of the control system, a reference value generator for deriving a desired equilibrium state and an approximate control vector, a transition model to produce compatible reference point trajectories during gross transients, gain schedules for producing feedback terms appropriate to the flight condition, and integral switching logic to produce acceptable steady-state performance without engine operating limit exceedance are described and the details of the F100 implementation presented. The engine altitude test phase of the MVCS program, and engine responses in a variety of test operating points and power transitions are presented. A T

A79-39817 # Payback period - An engineering cost/benefit method. D E Webb (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, Conn.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1235 7 p*

An aircraft engine cost/benefit analysis method which uses the payback period (ratio of investment to before-tax annual cash savings) as the basic parameter is described. The payback period method provides a more accurate assessment of capital costs than does the conventional direct operating cost method, which considers only capital costs due to depreciation. The application of payback period analysis to design improvements in the JT8D turbofan engine is presented. C K D

A79-39818 * # Autoignition of hydrogen injected transverse to a supersonic airstream. C R McClinton (NASA, Langley Research Center, High Speed Aerodynamics Div., Hampton, Va.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1239 12 p 13 refs*

A parametric study of autoignition characteristics of transverse fuel injector patterns for a hydrogen-fueled, supersonic-combustion ramjet was conducted in direct-connect tests over a range of simulated hypersonic flight conditions. Autoignition limits, defined directly by visual observations and indirectly by measured wall pressure and temperature, are compared with a semi-empirical ignition limit model which accounts for first order effects on autoignition. It is shown that to initiate combustion in the immediate region of the fuel injector, ignition must occur in the separation region ahead of the fuel jet. Autoignition within this separation zone exhibits strong dependence on flow pressure and temperature, injector diameter, local boundary layer energy thickness, wall temperature, and on fluid dynamic interactions with adjacent downstream facing steps (such as inlet isolation steps). Secondary effects are also discussed. The empirical model is used to define limits of test temperature, pressure, and scale required for autoignition in a current subscale engine test program. (Author)

A79-39819 # Predicted F100 engine response to circumferential pressure and temperature distortion W. A. Walter and M. Shaw (United Technologies Corp., Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) *AIAA, SAE, and ASME, Joint Propulsion Conference, 15th, Las Vegas, Nev., June 18-20, 1979, AIAA Paper 79-1310* 6 p. 5 refs

An analytical compressor flow model was used to investigate the F100(3) engine response to inlet circumferential distortion. The response characteristics predicted and the use of these results in planning engine stability tests is presented. Engine responses predicted for three different pressure patterns and three different temperature distortion profiles were combined into five distortion cases with the results showing that compression system response to combined pressure and temperature distortion depends upon the relative orientation, the individual amplitude, and circumferential extents of distortions. It is concluded that improved engine stability tests can be designed using the Pratt and Whitney analytical distortion model, testing can be reduced by using the analytical model to extrapolate test results, and that analytical predictions are useful in planning engine distortion tests. A79-39873 Dry friction in the aerospace industry (Le frottement sec dans l'industrie aérospatiale) M. Armbruster (Société Nationale Industrielle Aérospatiale, Laboratoire Central, Paris, France) *Revue Française de Mécanique*, 3rd Quarter, 1978, p. 5-10. 6 refs. In French

An overview of applications of dry friction in the aerospace industry is given. The characteristics of different dry friction materials, including polymers, metals and inorganics, and solid lubricants are described. Three specific applications of dry friction in aerospace technology are examined: dry lubricants for bearings used in satellites, dry journal bearings for helicopter blade assemblies, and dry spherical swivels in airplane control surfaces. C K D

A79-39889 The F-16 RIW program H. Balaban, G. Harrison (Ariac Research Corp., Annapolis, Md.), and D. Cuppett (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio) In *Annual Reliability and Maintainability Symposium*, Washington, D.C., January 23-25, 1979, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1979, p. 79-82. 8 refs

The F-16 RIW program is considered to be the most complex warranty procurement to date, involving a multinational logistics cooperative effort. Nine avionics line replaceable units (LRUs) are covered by the warranty, the coverage encompassing such elements as guaranteed MTBF, guaranteed turnaround times, and LRU/module-level maintenance. This paper summarizes the background of the procurement, the major RIW features, and current issues that will influence the success of the RIW program. (Author)

A79-39890 The operational impact of Navy's first TAAF program J. R. Farrell (US Navy, Naval Material Command, Washington, D.C.) and H. J. Kindl (General Electric Co., Aerospace

Electronic Systems Dept., Utica, N.Y.) In *Annual Reliability and Maintainability Symposium*, Washington, D.C., January 23-25, 1979, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1979, p. 116-120. 5 refs

A Test, Analyze, and Fix (TAAF) reliability growth test program was carried out on Logic Unit 4 (LU-4), a part of the data analysis programming group AN/AYA-8 for the P-3C ASW patrol aircraft. This device contains 9910 electronic parts and an electro-mechanical magnetic drum memory. The testing involved a total of 2751 operating hours in a MIL-STD-781B Test Level E environment. The test duration was determined from MIL-HDBK-217A failure rates and empirical failure rates of microcircuits from AYA-8 field data and the rule that the MTBF expected early in the test program is 10% of the prediction. The cumulative MTBF was plotted, and a mean-square fit growth line was obtained with a slope of 0.44, which compares favorably with the planned growth of 0.4. Thirteen corrective actions were also validated by exposing test articles to at least 200 hours of test. The testing showed that the equipment should have a MTBF in excess of 930 hours, which has been confirmed by subsequent field data. P T H

A79-39893 CERT technology applied to an airborne radar H. J. Caruso, W. Silver, D. J. Cichetti, and D. M. Kubilus (Westinghouse Product Qualification Laboratory, Baltimore, Md.) In *Annual Reliability and Maintainability Symposium*, Washington, D.C., January 23-25, 1979, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1979, p. 131-135. 7 refs

The effectiveness of Combined Environmental Reliability Testing (CERT) is examined, considering the questions of necessary degree of realism, return on investment, test program structure, and Life-Cycle Cost Impact. Candidate CERT facility designs are described, noting that complex environmental stress profiles and combinations can be performed with no more facility operators than required for single-environment tests, and existing reliability facilities can be modified to CERT requirements. The major advantage of CERT is its simultaneous disclosure of single environment failure modes, improving growth rate and more efficient use of available test time. The value of CERT for disclosing synergistic failure modes is unresolved because such failure modes comprise only a small part of the total failure population or they are sensitive to as yet undefined variations in environmental combinations and dynamics. It is concluded that the timely use of CERT in program phases or in combination with traditional test methodology can result in development cost reductions and schedule benefits. A T

A79-39895 # The aircraft air conditioner data revisited H. Ascher (US Navy, Naval Research Laboratory, Washington, D.C.) and H. Feingold (US Naval Material Command, David W. Taylor Naval Ship Research and Development Center, Bethesda, Md.) In *Annual Reliability and Maintainability Symposium*, Washington, D.C., January 23-25, 1979, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1979, p. 153-159. 13 refs

Using Proscian's Air Conditioning data as a vehicle, this paper highlights some of the basic dissimilarities between repairable and nonrepairable system concepts. Widespread confusion over these concepts has obscured a salient feature of these data - overhaul degraded air conditioners. (Author)

A79-39900 RELSIM-A systems reliability simulation code E. P. Schelonka (California, University, Los Alamos, N. Mex.) In *Annual Reliability and Maintainability Symposium*, Washington, D.C., January 23-25, 1979, Proceedings. New York, Institute of Electrical and Electronics Engineers, 1979, p. 194-197

A series of simulation programs designated RELSIM has been developed as part of the Los Alamos Scientific Laboratory Nuclear Safeguards Program to provide reliability projections for large interconnected arrays of digital components. RELSIM is capable of

simulating the general case of up to several hundred units linked in networks having a full range of tandem and parallel network configuration options, including those with nonidentical components in parallel

A79-39912 **Development of in-flight steady-state failure rates** M B Shurman (Boeing Aerospace Co., Seattle, Wash.) In Annual Reliability and Maintainability Symposium, Washington, D C., January 23-25, 1979, Proceedings New York, Institute of Electrical and Electronics Engineers, 1979, p 323-325

Two complementary procedures for converting failure rate data to in-flight steady-state failure rates are described. In the first approach, handbook-derived abort failure rate data and non-abort reliability data derived from field experience are used to calculate the nominal sortie duration for a given aircraft. The second used total failure rate data from handbooks together with average maintenance hours per fix to compute the maintenance manhours per flight hour for unscheduled maintenance. The final step in both methods is the calculation of a conversion constant to obtain in-flight steady state failure rates

A79-39914 **Lower avionics temperature - Lower life cycle cost** D E Tuttle and M N Schwartz (Lockheed-California Co., Burbank, Calif.) In Annual Reliability and Maintainability Symposium, Washington, D C., January 23-25, 1979, Proceedings New York, Institute of Electrical and Electronics Engineers, 1979, p 332-337 8 refs Contract No N00163-77-C-0296

Results of a trade-off study evaluating the effects of environmental control system design on the reliability and maintainability of a modular avionics package for a V/STOL Type A aircraft are presented. A baseline design offering the lowest total aircraft life cycle cost (LCC) was sought. Differences in LCC were determined by summation of subsystem acquisition cost, aircraft gross takeoff weight (GTOW) specific cost, fuel cost, and cost to maintain over the projected life of the aircraft. Reliability and weight were found to be driving factors in cost analysis. Five environmental control systems were analyzed. Minimum LCC was associated with a Freon vapor cycle system using recirculated air to provide component temperatures of 40 to 45 deg C

A79-39915 **Reliability and maintainability contribution to Hornet mission success** R L McGee (McDonnell Douglas Corp., St Louis, Mo.) In Annual Reliability and Maintainability Symposium, Washington, D C., January 23-25, 1979, Proceedings New York, Institute of Electrical and Electronics Engineers, 1979, p 338-341

The development of the weapon system design of the Hornet fighter/attack aircraft to satisfy duel requirements of 3.7 mean flight hours between failures and 0.8 mission completion probability is discussed. The impact of the mean flight time between failures requirement on maintainability, availability, and life cycle cost is examined. Reliability data for different Hornet subsystems are presented
C K D

A79-39919 **RTCA standards - Improved specs and regulations** W C Fuchs (Radio Technical Commission for Aeronautics, Washington, D C.) In Annual Reliability and Maintainability Symposium, Washington, D C., January 23-25, 1979, Proceedings New York, Institute of Electrical and Electronics Engineers, 1979, p 381-383

The Radio Technical Commission for Aeronautics (RTCA) develops minimum performance standards for avionics and telecommunications. These standards have been employed as specifications by manufacturers, and have also served as the basis for government regulation of the aviation industry. Subjects under consideration by RTCA committees during 1978 included ground proximity warning

equipment, emergency locator transmitters, airborne Omega receivers, future civil aviation frequency spectrum requirements, and the role of mean-time-before-failure data in specifying safety standards.

A79-39920 **The effect of endless burn-in on reliability growth projections** A G Bezat and L L Montague (Honeywell, Inc., Avionics Div., St Louis Park, Minn.) In Annual Reliability and Maintainability Symposium, Washington, D C., January 23-25, 1979, Proceedings New York, Institute of Electrical and Electronics Engineers, 1979, p 392-397

Current reliability prediction methods treat solid-state electronics equipment on the basis of a constant failure rate throughout the operating life of the equipment. This paper presents an extensive data base (over 19 billion part hours), supported by theory, that shows failure rate of solid state electronics to be a decreasing function with operational age of individual equipment. Data is presented in graphical form, including a best fit equation for the data. The mechanics of prediction methods are shown, along with examples. The entire concept is summarized as a family of growth curves, wherein the applicable curve is dependent upon the design/process maturity of the equipment at the time it is manufactured

CHARACTERISTICS OF THE ADVANCED SUPERSONIC TECHNOLOGY AST-105-1 CONFIGURED FOR TRANSPACIFIC RANGE WITH PRATT AND WHITNEY AIRCRAFT VARIABLE STREAM CONTROL ENGINES
Hal T Baber Jr Mar 1979 134 p refs
(NASA-TM-78818) Avail NTIS HC A07/MF A01 CSCL 02A

Credence to systems weights and assurance that the noise study AST concept can be balanced were studied. Current titanium structural technology is assumed. A duct-burning turbofan variable stream control engine (VSCE), with noise reduction potential through use of a conannular nozzle was used. With 273 passengers range of the AST-105-1 for a cruise Mach number of 2.62 is essentially transpacific. Lift-to-drag ratio is slightly higher than for previous AST configurations. It is trimmable over a center-of-gravity range of 4.7m (15.5 ft). Inherent high positive effective dihedral, typical of arrow-wing configurations in high-lift approach would limit AST-105-1 to operating in crosswinds of 11.6 m/sec (22.4 kt) or less with 75 percent of available lateral control. Normal power takeoff with cutback results in noise in excess of Federal Aviation Regulation Part 36 but less than for conventional procedure takeoff. Results of advanced (noncertificated) programmed throttle takeoff and approach procedures not yet optimized indicate that such can be an important additional method noise reduction. SES

LOW-SPEED SINGLE-ELEMENT AIRFOIL SYNTHESIS
John H McMasters and Michael L Henderson In NASA Langley Res Center The Sci and Technol of Low Speed and Motorless Flight Pt 1 1979 p 1-31 refs

Avail NTIS HC A13/MF A01 CSCL 01A

The use of recently developed airfoil analysis/design computational tools to clarify and extend the existing experimental data base on low-speed single element airfoils is demonstrated. A discussion of the problem of tailoring an airfoil for a specific application at its appropriate Reynolds number is presented. This problem is approached by use of inverse (or synthesis) techniques wherein a desirable set of boundary layer characteristics performance objectives and constraints are specified which then leads to derivation of a corresponding viscous flow pressure distribution. Examples are presented which demonstrate the synthesis approach following presentation of some historical

information and background data which motivate the basic synthesis process. GY

AN EXPLORATORY INVESTIGATION OF THE EFFECT OF PLASTIC COATING ON THE PROFILE DRAG OF A PRACTICAL-METAL-CONSTRUCTION SAILPLANE AIRFOIL

Dan M Somers In its The Sci and Technol of Low Speed and Motorless Flight, Pt 1 1979 p 33-64 refs

Avail NTIS HC A13/MF A01 CSCL 01A

An exploratory investigation was performed in the Langley low-turbulence pressure tunnel to determine the effect of a plastic coating on the profile drag of a practical-metal-construction sailplane airfoil. The model was tested with three surface configurations: (1) filled, painted and sanded smooth; (2) rough bare metal; and (3) plastic-coated. The investigation was conducted at Reynolds numbers based on airfoil chord of 1,100,000, 2,200,000, and 3,300,000 at a constant Mach number of 0.10. The results indicate that at all three Reynolds numbers the order of the drag values of the three surface configurations starting with the highest drag, was filled, painted and sanded smooth, rough bare metal, and plastic-coated. OPTIMUM TAIL PLANE DESIGN FOR SAILPLANES

Kay Mayland In NASA Langley Res Center The Sci and Technol of Low Speed and Motorless Flight Pt 1 1979 p 65-80 refs

Avail NTIS HC A13/MF A01 CSCL 01C

Classical drag equations in a modern version were used to calculate the influence of tail modifications on the drag of a standard class sailplane. The profile drag which depends on the Reynolds number is included in the calculations. Minimum drag is compared with real drag for two lift coefficients. Some results have no clear tendency but low tail area and relatively low tail aspect ratio give some advantages. Optimum and real lift ratios between wing and tail plane are compared for the original sailplane. GY

THE EFFECT OF DISTURBANCE ON A WING

Richard Eppler In NASA Langley Res Center The Sci and Technol of Low Speed and Motorless Flight Pt 1 1979 p 81-92 refs

Avail NTIS HC A13/MF A01 CSCL 01A

Disturbances such as flap and aileron hinges and poorly faired spoilers were simulated in a computer wind tunnel. The total drag of a single roughness element does not depend only on the size of that element. Its position on the wing has a surprisingly strong effect. In particular, a roughness element on the convex side of a deflected flap or aileron causes a very substantial increase in drag. Very few experimental data are available for comparison. Good agreement with experiment can be achieved, however, by adapting a fictive step size. The correlation between the real roughness-element size and the drag increase remains to be determined. Simple, fundamental experiments are suggested which will allow a theoretical estimation of the drag increase due to roughness elements. GY

The applications of aerodynamics particularly in rocket technology and modern high-speed aviation are studied along with the general laws of motion of a gas medium The first six

chapters of the book cover the following basic concepts and definition of aerodynamics kinematics of a fluid medium equations of motion of a gas in the general case (where variations in its physico-chemical properties are considered), the theory of shock waves, the method of characteristics (very widely used in the investigation of supersonic flows), and the general theory of the motion of a gas in two-dimensional space. The practical applications or connections with the formulation of methods of aerodynamic calculations for flight vehicles and their individual elements are shown. G Y

INVESTIGATION OF AERODYNAMIC CHARACTERISTICS OF SUBSONIC WINGS Final Report

Fred R DeJarnette and Neal T Frink 11 Jun 1979 148 p refs

(Grant NSG-1437)

(NASA-CR-158661) Avail NTIS HC A07/MF A01 CSCL 01A

An analytical strake design procedure is investigated. A numerical solution to the governing strake design equation is used to generate a series of strakes which are tested in a water tunnel to study their vortex breakdown characteristics. The strakes are scaled for use on a half-scale model of the NASA-LaRC general research fuselage with a 44 degrees trapezoidal wing. An analytical solution to the governing design equation is obtained. The strake design procedure relates the potential-flow leading-edge suction and pressure distributions to vortex stability. Several suction distributions are studied and those which are more

triangular and peak near the tip generate strokes that reach higher angles of attack before vortex breakdown occurs at the wing trailing edge. For the same suction distribution a conical rather than three dimensional pressure specification results in a better stroke shape as judged from its vortex breakdown characteristics

AN INVESTIGATION OF A FULL-SCALE ROTOR WITH FOUR BLADE TIP PLANFORM SHAPES

Robert H Stroub May 1979 72 p refs Sponsored in part by AVRADCOM (NASA-TM-78580 AVRADCOM-TR-79-14 A-7793) Avail NTIS HC A04/MF A01 CSCL 01A

A test of a full-scale helicopter rotor was conducted in the Ames Research Center 40- by 80-Foot Wind Tunnel to investigate performance loads and noise characteristics of rotors with various tip geometries. Four blade tip geometries were investigated: rectangular, trapezoidal, swept rectangular and swept trapezoidal. The investigation was accomplished over an advance-ratio range of 0.2 to 0.375 and an advancing blade Mach number range of 0.72 to 0.97. The performance aspects are presented with power comparisons between tip shapes. On a power basis the best overall tip shape was the swept-trapezoidal geometry

MINIMIZATION THEORY OF INDUCED DRAG SUBJECT TO CONSTRAINT CONDITIONS

John DeYoung Washington NASA Jun 1979 126 p refs (Contract NAS1-13500) (NASA-CR-3140) Avail NTIS HC A07/MF A01 CSCL 01A

Exact analytical solutions in terms of induced drag influence coefficients can be attained which define the spanwise loading with minimized induced drag, subject to specified constraint conditions for any nonplanar wing shape or number of lift plus wing bending moment about a given wing span station. Example applications of the theory are made to a biplane, a wing in ground effect, a cruciform wing, a V-wing, a planar-wing winglet and linked wingtips in formation flying. For minimal induced drag the spanwise loading, relative to elliptic, is outboard for the biplane and is inboard for the wing in ground effect and for the planar-wing winglet. A spinoff of the triplane solution provides mathematically exact equations for downwash and sidewash about a planar vorticity sheet having an arbitrary loading distribution

NUMERICAL OPTIMIZATION TECHNIQUES FOR BOUND CIRCULATION DISTRIBUTION FOR MINIMUM INDUCED DRAG OF NONPLANAR WINGS BASIC FORMULATIONS
Final Report

John Kuhlman Jun 1979 47 p refs (Grant NSG-1357) (NASA-CR-3154) Avail NTIS HC A03/MF A01 CSCL 01A

A theoretical method was developed for determining the optimum span load distribution for minimum induced drag for subsonic nonplanar configurations. The undistorted wing wake is assumed to have piecewise linear variation of shed vortex sheet strength resulting in a quadratic variation of bound circulation and span load. The optimum loading is obtained either through a direct technique, whereby derivatives of the drag expression are calculated analytically in terms of the unknown wake vortex sheet strengths. Both techniques agree well with each other and with available exact solutions for minimum induced drag

(Contract MIN-DEF/PE-AT/2057/042)

(OUEL-1235/78) Avail NTIS HC A02/MF A01

In order to carry out a comprehensive experimental survey of aerodynamic force on slender axisymmetric bodies in rarefied hypersonic flow an electromagnetic jig and balance was built for use with the Oxford University low density tunnel. The design of this apparatus was based on the magnetic jig for spheres built in the same laboratory. The drag force measurements on sharp cones are given for freestream Reynolds numbers based on cone diameter of 120 to 1200 at free stream Mach numbers between 5 and 9. These data were obtained by using a contoured nozzle and free jets. The results from the two types of flow devices overlapped and afforded direct comparisons between them. Comparisons are made with other experimental results and the general correlation of all relevant data is discussed. Author (ESA)

TECHNICAL EVALUATION REPORT ON THE 27TH GUIDANCE AND CONTROL PANEL SYMPOSIUM ON THE V/STOL AIRCRAFT AT NIGHT AND IN POOR VISIBILITY

G C Howell (RAE, Bedford, Engl) May 1979 13 p (AGARD-AR-142 ISBN-92-835-1319-3) Avail NTIS HC A02/MF A01

The desire of operators of all three services of the NATO nations to extend the use of helicopters and V/STOL aircraft into night and conditions of poor visibility has caused an expansion of activity in various technological fields but most particularly in the electro-optical and radar sensors of various kinds. The integration of these new sensors into modern navigation, flight control and display systems is an important aspect - particularly in helicopters where space and weight are at a premium. Also the pilot workload is already high in helicopters and V/STOL aircraft near the ground and any new technology must be introduced in a manner to keep the workload within bounds so as not to lose the benefits of the new sensors. ENERGY MANEUVERABILITY DISPLAY VALIDATION Final Report, May 1976 - Apr 1978

A H Lusty Jr M K Fox, J M Norton and R J Wenham Apr 1978 121 p (Contract F33615-76-C-3099) (AFFDL-TR-78-35-Vol-1 AF Proj 2403) Avail NTIS HC A06/MF A01

Comparative testing of the F-16 aircraft energy maneuverability display (EMD) and a conventional display (CD) was performed in an F-16 simulation implemented on a large amplitude multimode aerospace research simulator. The test subjects (fighter pilots) performed two basic maneuvers with each display. Flight times were recorded for the turn and energy gain portions of each maneuver. These times were statistically compared and engineering conclusions were made. Results of the simulation tests show that (1) for the hard turn maneuver the CD (with well-chosen rules-of-thumb) and the EMD are equally effective, (2) for the energy gain maneuver the CD and the EMD are equally effective for the 'clean' configuration however, for configurations with stores, the use of the EMD shows a significant advantage, and (3) for the combined sustained energy turn and energy gain maneuver the EMD is more effective than the CD for all configurations tested. SUBSTRUCTURING METHODS FOR DESIGN SENSITIVITY ANALYSIS AND STRUCTURAL OPTIMIZATION Interim Technical Report, May - Aug 1977

A K Govil J S Arora, and E J Haug Aug 1977 229 p refs (Contracts DAAK11-77-C-0023 DAAA09-76-C-2013) (AD-A065935 TR-34) Avail NTIS HC A11/MF A01 CSCL 01/3

This report presents an iterative method for optimal design of large scale structures that incorporates the concept of substructuring. Design sensitivity analysis for the method is developed in a state space setting in which the symmetry of the structural stiffness matrix is utilized to define efficient adjoint calculations that yield explicit design derivatives. The entire procedure is then presented as a convenient computational algorithm. Applications of the method are given for optimal design of two and three dimensional truss idealized wing and framed structures. Computer programs based on the present algorithm are presented for three truss structures (10 member plane cantilever truss, 200 member plane truss, 63 member space truss), three idealized wing structures (18 element wing box beam, 39 element rectangular wing, 150 element swept wing) and three framed structures (one-bay two-story plane frame, two-bay six-story plane frame, 48 element space frame). Results obtained with the substructuring formulation are compared first with results obtained without substructuring and then with results obtained with other methods. GRA

NOVA-2S, A STIFFENED PANEL EXTENSION OF THE NOVA-2 COMPUTER PROGRAM Final Report

Lawrence J Mente and William N Lee Kirtland AFB, N Mex Air Force Weapons Lab Dec 1978 153 p refs (Contract F29601-78-C-0019) (AD-A066038, AD-E200233 KA-TR-153 APNL-TR-78-182) Avail NTIS HC A08/MF A01 CSCL 01/3

A stiffened panel extension is developed into the NOVA-2S and NOVA-2LTS computer programs which replace the NOVA-2 and NOVA-2LT programs for nuclear overpressure vulnerability

and analysis of aircraft. These new versions are capable of analyzing a stiffened flat or cylindrical panel in both the elastic and inelastic response regions as well as retaining the capability of analyzing stiffeners and pure panels, individually. In the stiffened panel analysis the stiffeners are treated discretely in either or both coordinate directions and are allowed various eccentric positions relative to the single-layered, multilayered and honeycomb panel skin configurations. The stiffened panel analysis is evaluated successfully by comparing the analytical solutions with experimental results from 3 test programs that measured strains and displacement responses on stiffened panels. An evaluation of the stiffened panel analysis versus the approach of analyzing individual elements of the stiffened panel is made by comparing the two approaches on the basis of response quantities at constant range and slant ranges at constant damage level. Three stiffened panels that are very similar to those found on the B-52 aircraft were used and it was concluded that, in general, the individual element approach is not adequate and the stiffened panel analysis should be used for these types of stiffened panels. THE PRODUCTION FUNCTION AND AIRFRAME COST ESTIMATION M S Thesis

John A Long Dec 1978 75 p refs
 (AD-A065570 AFIT/GOR/SM/78D-8) Avail NTIS
 HC A04/MF A01 CSCL 14/1

In recent years, men and governments have become keenly aware of the huge capital outlays necessary in the acquiring of new weapons systems. Increased burden on limited capital has required more complete and careful planning. This planning has led to the need for accurate and timely cost predictions of new systems. Historically the variables affecting the future cost of aircraft airframes have been proven to be airframe weight and aircraft speed. These are often combined with learning hypothesis to form an airframe cost model. In this paper the production function of microeconomics is combined with weight, speed and learning to form a nonlinear cost estimation model. Nonlinear least squares regression analysis was used in evaluating this model. Although the results are inconclusive based on the data used, weight and speed combined with learning still appear to be the best predictors of aircraft airframe cost. Author (GRA)

A digital computer program has been developed for simulating the launch and recovery of VSTOL aircraft operating from small ships. Volume 1 of this report describes the program, Volume 2 is the user's manual. The program known as VOLAR (Vought Launch and Recovery Dynamics Program) employs the computational technique of nonlinear covariance propagation. This permits the time histories of the means and variances of all systems state variables to be computed from a single run, as opposed to the Monte Carlo technique which requires multiple runs plus subsequent averaging. Typically VOLAR requires approximately 7 percent of the computer time required for comparable Monte Carlo simulations. The program includes a general airframe mathematical model suitable for helicopters or fixed-wing aircraft. The airwake of a small ship is also modeled and ship motion models are included. Two alternative models of the human pilot are supplied: one is based on verbal adjustment rules, the other is based on optimal control theory, utilizing performance index parameters deduced from manned simulator experiments. The program is demonstrated for AV-8A recovery on a small ship. The trends predicted by VOLAR are shown to agree with flight test data. Author (GRA)

PREDICTION OF THE ANGULAR RESPONSE POWER SPECTRAL DENSITY OF AIRCRAFT STRUCTURES Final Report, Jan 1976 - Jun 1978

Jon H Lee Michael Obal W and Dansen L Brown Dec 1978 98 p refs
 (AD-A066141 AFFDL-TR-78-188) Avail NTIS
 HC A05/MF A01 CSCL 01/3

The design of airborne electro-optical systems requires the knowledge of angular vibration as well as linear vibration of aircraft structures. Rather than predicting the angular vibration subject to aerodynamic and acoustic excitations, an attempt is made here to relate the angular vibration directly to the linear vibration response. With the Bernoulli-Euler beam used as a theoretical model, a relationship has been derived between the linear and angular vibration power spectral density functions. Based on this relationship together with the angular root-mean-squared vibration amplitude as previously predicted by Lee and Whaley (AFFDL-TR-76-56, AF Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio), it is now possible to predict the angular power spectral density and a length scale associated with the angular measurement technique. Tested on the typical flight test data of RF-4C and F-15 fighters, CH-3E helicopter, and B-52 bomber, the predicted angular power spectral density lies within a + or - 0 db band about the measurement. Though crude, such a prediction is useful in the preliminary design stage in that one can quickly estimate the angular vibration environment prior to fabrication. Author (GRA)

The objective of the Avionics Standardization Potential Analysis program is to develop a general methodology for evaluating the benefits accruing from the use of standard equipment across future USAF avionics systems. The methodology has been developed using navigation avionics as being representative of avionics in general, in a study of standardization potential across navigation systems (SPANS). The methodology covers the process of establishing future avionics systems requirements through mission analysis, identification of available equipment for the design of mission-responsive avionics suites, evaluation of future quantitative demands for avionics equipment, synthesis of mission-capable avionics systems, collection of relevant cost and reliability data and evaluation of standardization options using a computer-based Standardization Evaluation Program (STEP).

COMBINED PRESSURE AND TEMPERATURE DISTORTION EFFECTS ON INTERNAL FLOW OF A TURBOFAN ENGINE

W M Braithwaite and Ronald H Soeder 1979 19 p refs Presented at the 15th Joint Propulsion Conf Las Vegas, 18-20 Jun 1979 cosponsored by AIAA, the Soc of Automotive Engr and ASME (NASA-TM-79136, E-9984) Avail NTIS HC A02/MF A01 CSCL 21E

An additional data base for improving and verifying a computer simulation developed by an engine manufacturer was obtained. The multisegment parallel compressor simulation was designed to predict the effects of steady-state circumferential inlet total-pressure and total-temperature distortions on the flows into and through a turbofan compression system. It also predicts the degree of distortion that will result in surge of the compressor. The effect of combined 180 deg square-wave distortion patterns of total pressure and total temperature in various relative positions is reported. The observed effects of the combined distortion on a unitary bypass ratio turbofan engine are presented in terms of total and static pressure profiles and total temperature profiles at stations ahead of the inlet guide vanes as well as through the fan-compressor system. These observed profiles are compared with those predicted by the complex multisegment model. The effects of relative position of the two components comprising the combined distortion on the degree resulting in surge are discussed. Certain relative positions required less combined distortion than either a temperature or pressure distortion by itself. SES

LEAN, PREMIXED, PREVAPORIZED COMBUSTION FOR AIRCRAFT GAS TURBINE ENGINES

Edward J Mularz 1979 18 p refs Presented at the 15th Propulsion Conf Las Vegas, 18-20 Jun 1979 cosponsored by AIAA the Soc of Automotive Eng and ASME Prepared in cooperation with Army Aviation Res and Develop Command, St Louis Mo (NASA-TM-79148 E-004, AVRADCOM-TR-79-18) Avail NTIS HC A02/MF A01 CSCL 21E

The application of lean, premixed prevaporized combustion to aircraft turbine engine systems can result in benefits in terms of superior combustion performance improved combustor and turbine durability and environmentally acceptable pollutant emissions. Lean, premixed prevaporized combustion is particularly attractive for reducing the oxides of nitrogen emissions during high altitude cruise. The NASA stratospheric cruise emission reduction program will evolve and demonstrate lean premixed, prevaporized combustion technology for aircraft engines. This multiphased program is described. In addition the various elements

of the fundamental studies phase of the program are reviewed and results to date of many of these studies are summarized.

EFFECT OF DEGREE OF FUEL VAPORIZATION UPON EMISSIONS FOR A PREMIXED PREVAPORIZED COMBUSTION SYSTEM

L P Cooper 1979 17 p refs Presented at the 15th Joint Propulsion Conf Las Vegas 18-20 Jun 1979, cosponsored by AIAA, SAE and ASME (NASA-TM-79154 E-010) Avail NTIS HC A02/MF A01 CSCL 21E

An experimental and analytical study of the combustion of partially vaporized fuelair mixtures was performed to assess the impact of the degree of fuel vaporization upon emissions for a premixing-prevaporizing flametube combustor. Data collected show near linear increases in nitrogen oxide emissions with decreasing vaporization at equivalence ratios of 0.6. For equivalence ratio of 0.72 the degree of vaporization had very little impact on nitrogen oxide emissions. A simple mechanism which accounts for the combustion of liquid droplets in partially vaporized mixtures was found to agree with the measured results with fair accuracy with respect to both trends and magnitudes. EFFECT OF SHOCKS ON FILM COOLING OF A FULL SCALE TURBOJET EXHAUST NOZZLE HAVING AN EXTERNAL EXPANSION SURFACE

David M Straight 1979 20 p refs Presented at the 15th Joint Propulsion Conf Las Vegas 18-20 Jun 1979 cosponsored by AIAA, SAE and ASME (NASA-TM-79157 E-013) Avail NTIS HC A02/MF A01 CSCL 21E

Experimental film cooling data obtained during exploratory testing with an axisymmetric plug nozzle having external expansion and installed on an afterburning turbojet engine in an altitude test facility is presented. The shocks and local hot gas stream conditions had a marked effect on film cooling effectiveness. An existing film cooling correlation was adequate at some operating conditions but inadequate at other conditions such as in separated flow regions resulting from shock boundary layer interactions. EFFECTS OF STEADY-STATE PRESSURE DISTORTION ON THE STALL MARGIN OF A J85-21 TURBOJET ENGINE

George A Bobula Mar 1979 28 p refs Prepared in cooperation with Army Aviation Research and Development Command Cleveland St Louis Mo (NASA-TM-79123 E-9958 AVRADCOM-TR-79-12) Avail NTIS HC A03/MF A01 CSCL 21E

The effects of the inlet pressure distortions induced by five screen patterns on the performance of a J85-21 turbojet engine was conducted at the NASA Lewis Research Center. Testing was in support of the HiMAT RPRV program at Dryden Flight Research Center. Distortion patterns were chosen based on anticipated application of test results of the HiMAT installation. Tests were conducted at a simulated Mach number and altitude condition of 0.9 and 10 973 meters. Results are presented in terms of distortion levels and standard compressor performance parameters. EFFECT OF STEADY-STATE PRESSURE DISTORTION ON FLOW CHARACTERISTICS ENTERING A TURBOFAN ENGINE

Ronald H Soeder and George A Bobula Apr 1979 34 p refs Prepared in cooperation with Army Aviation Research and Development Command St Louis Mo (NASA-TM-79134 E-9982, AVRADCOM-TR-79-19) Avail NTIS HC A03/MF A01 CSCL 21E

Flow angle static-pressure and total-pressure distributions were measured in the passage ahead of a turbofan engine operating with inlet pressure distortion. Distortions were generated with five screen configurations and one solid plate configuration. The screens and solid plate were circumferential and mounted on a rotatable assembly. Reynolds Number Index upstream of the distortion device was maintained at 0.5, 0.35, or 0.2 and engine corrected low-rotor speeds were held at 6000 rpm and 8600 rpm. Near the engine inlet, flow angle was largest at the hub and increased as flow approached the engine. The magnitude of static-pressure distortion measured along the inlet-duct and extended bullet nose walls increased exponentially as the flow approached the engine. Wall static-pressure distortion was also a function of distortion harmonic. Author

A variable area exit nozzle arrangement for an aircraft engine having a substantially reduced length and weight is described. It comprises longitudinally movable radial vanes and fixed radial vanes. The movable radial vanes are alternately disposed with respect to the fixed radial vanes. Means for displacing the movable radial vanes along the longitudinal axis of the engine relative to the fixed radial vanes are determined. The fixed radial vanes radially extend across the main exhaust flow of the engine. NASA

The purpose of this program was to reduce the difficulty of drive-shaft alignment and to improve dynamic alignment by allowing inflight measurement on Army UH-1/AH-1 helicopters. Under Contract DAAJ02-76-C-0010, a first-concept driveshaft alignment indicator was investigated. The program included ground and flight tests on an Army UH-1 helicopter. A second-generation concept was evolved which indicated improved accuracy and greatly reduced system cost. The second-generation concept was investigated under Contract DAAJ02-77-C-0006. The investigation included design and manufacture of a prototype alignment measuring tool ground and flight tests and a survey of the existing driveshaft alignments of Army helicopters. The survey included eight UH-1 at Bradley Field Connecticut ten UH-1 at Felker Field Fort Eustis, Virginia and ten UH-1 at Simmons Field Fort Bragg North Carolina. Subsequently three AH-1 were measured at Felker Field and finally a UH-1 with sling load was measured at Kaman. The significant measurements were static alignment hover at a 5-foot skid height, and low-speed high-power climb (70 knots forward speed, 1000 ft/minute climb). GRA

A SIMPLIFIED ROTOR SYSTEM MATHEMATICAL MODEL FOR PILOTED FLIGHT DYNAMICS SIMULATION

Robert T N Chen May 1979 28 p refs
 (NASA-TM-78575 A-7538) Avail NTIS HC A03/MF A01 CSDL 01C

The model was developed for real-time pilot-in-the-loop investigation of helicopter flying qualities. The mathematical model included the tip-path plane dynamics and several primary rotor design parameters such as flapping hinge restraint, flapping hinge offset, blade Lock number and pitch-flap coupling. The model was used in several exploratory studies of the flying qualities of helicopters with a variety of rotor systems. The basic assumptions used and the major steps involved in the development of the set of equations listed are described. The equations consisted of the tip-path plane dynamic equation, the equations for the main rotor forces and moments and the equation for control phasing required to achieve decoupling in pitch and roll due to cyclic inputs. ACTIVE CONTROL FOR THE TOTAL-IN-FLIGHT SIMULATOR (ACTIFS) Final Report

E G Rynaski D Andrisani II and N Weingarten Apr 1979 303 p refs Sponsored by NASA
 (Contract F33615-73-C-3051)
 (NASA-CR-3118, AK-5280-F-11) HC A14/MF A01 CSDL 01C

An identification procedure was developed that is used to systematically improve or update the mathematical model of the aeroelastic behavior of an airplane. A mathematical model that was originally obtained by analytical or theoretical methods is made amenable to piecemeal acceptance of parameters estimated from the data taken during flight tests. Linear optimal control theory was used to evolve a performance index specifying closed loop system dynamics. Control laws for the proper pole placement of seven modes of motion of the TIFS airplane, two rigid body and five elastic modes were specified according to criteria developed. The phase variable canonical transformation was used to help specify a minimum complexity observer network that required no interconnections of the sensor outputs and no measurements of the control input. A conceptual design example of a simplified observer feedback control law for structural mode control of the TIFS airplane is presented. Gust alleviation techniques involving direct gust measurement and maneuver load control techniques were also developed, resulting in a command augmentation system that simultaneously commands multiple surface deflections to a pilot command input. PRECISION CONTROLLABILITY OF THE F-15 AIRPLANE
 Thomas R Sisk and Neil W Matheny May 1979 46 p refs
 (NASA-TM-72861 H-1073) Avail NTIS HC A03/MF A01 CSDL 01C

A flying qualities evaluation conducted on a preproduction F-15 airplane permitted an assessment to be made of its precision controllability in the high subsonic and low transonic flight regime over the allowable angle of attack range. Precision controllability, or gunsight tracking studies were conducted in windup turn maneuvers with the gunsight in the caged pipper mode and depressed 70 mils. This evaluation showed the F-15 airplane to experience severe buffet and mild-to-moderate wing rock at the higher angles of attack. It showed the F-15 airplane radial tracking precision to vary from approximately 6 to 20 mils over the load factor range tested. Tracking in the presence of wing rock essentially doubled the radial tracking error generated at the lower angles of attack. The stability augmentation system affected the tracking precision of the F-15 airplane more than it did that of previous aircraft studied. Author

Fatigue tests were conducted on adhesive bonded aluminum specimens with intentionally induced adhesive bondline flaws. Specimen design details, materials type of surface preparation. The test loadings were selected to be representative of those on the bonded wide-body fuselage test article designed and built in the PABST program. Tests conducted in this report show that bondline flaws loaded primarily in shear did not grow whereas those loaded by peel or tension forces did exhibit flaw growth. Flaw growth rate was higher at the slow rate of two cycles per hour than for a fast-cycle rate of 30 Hz. Bondline flaws grew incrementally with load cycles and could be tracked by state-of-the-art NDE. Author (GRA)

HC A04/MF A01 CSCL 11/8

At the present time all three military services use the Spectrometric Oil Analysis Program (SOAP) for the routine analysis of engine oil samples. The purpose of this program is to continually monitor the amounts of wear metal contaminants found in engine oil as an indicator of engine wear and possible engine failure. Use of such a program results in large savings by extending the time between oil changes and more importantly by indicating when engines should be taken out of service for preventive maintenance. The current program uses either atomic emission or atomic absorption for the analysis. The problems associated with the current methods are twofold. First, the instruments require a laboratory environment and the results from a particular sample may take days to return to the user. Under these conditions an engine might be operated to failure before notification of a failed oil sample. Secondly, the instruments are fairly expensive. This report summarizes the research which was done using Californium-252 as a neutron source in order to determine the feasibility of using such a source for analyzing USAF aircraft engine oil samples by neutron activation techniques. The desired solution would be an inexpensive facility which could be located on every flightline and provide the individual concentration of 13 different elements in each oil sample prior to the aircraft being flown again. The analysis of the high frequency radiation pattern of an antenna mounted near an elliptic disk is the object of this research. This is an analytic study of basic antenna types using GTD (ray optical) techniques. The elliptic disk is modelled as a perfectly conducting flat plate and patterns are taken in the far field. An equivalent current modification is introduced to correct caustic and pseudo-caustic regions where the GTD solution fails. The validity of the solution is shown by comparing the predicted pattern against measured results. The elliptic disk solution can be used to approximate antenna patterns of antenna mounted near arbitrary cross-section flat plates. This solution can also be used as part of an elliptic cylinder solution for aircraft and ship models. Author (GRA)

An iterative synthesis procedure is presented and applied to the problem of computing the complex aperture distribution of an antenna given its far field magnitude pattern. The methods employed are applicable to antennas composed of either discrete or continuously distributed apertures flush-mounted in a finite or infinite ground plane. The solutions obtainable with the procedure are particularly useful for subsequent numerical computation of an antenna's radiation pattern performance when introduced into a different structural environment. Several example solutions are presented to demonstrate the procedure and to point out specific techniques found useful in its implementation. Author (GRA)

An approximate asymptotic high frequency result which is convenient for engineering applications is obtained for the field scattered by a smooth perfectly-conducting convex cylinder when it is illuminated by a plane wave. This result is uniform in the sense that it remains valid within the transition regions adjacent to the shadow boundaries where the pure ray optic (or GTD) solution fails and it automatically reduces to the ray optic solution exterior to the transition regions where the latter solution becomes valid. Furthermore this result is expressed in the convenient format of the GTD and it employs the same ray paths as in the GTD solution. This uniform result is not valid in

the close neighborhood of the cylinder hence a separate asymptotic result is presented for this special case in a form which is also convenient for applications. The asymptotic results presented here are useful for predicting the patterns of antennas radiating in the presence of convex conducting cylindrical structures. Author (GRA)

The communication problem, requirements and solutions for helicopters flying nap-of-the-earth (NOE) in the modern battlefield are given. A model for predictions of communication ranges in irregular terrain (terrain noise environment and radio system parameters as variables) was developed. Model inputs are median basic transmission loss man-made atmospheric and galactic noise, candidate radio system parameters (Transmitter ERP and required SNR at receiver), and the standard deviations of these parameters. The model output is the probability of successful communication at a given range in irregular terrain. The model was used in the European SCORES scenario to predict communication and mission effectiveness in the Fulda region for candidate radio systems. Limited model validation data are given. Quantitative test results for the TCATA FM-320 NOE communication test are given and discussed. These tests compared the AN/ARC-117 Baseline radio with other radio candidates 40-W VHF Retransmission and HF/SSB. In addition quantitative results are given for VHF/FM HF/SSB and satellite NOE systems tests. JMS

DIAGNOSTICS OF WEAR IN AERONAUTICAL SYSTEMS

L D Wedeven 1979 5 p refs Presented at the 15th State-of-the-Art Symp on Corrosion and Wear Washington D C, 4-6 Jun 1979, sponsored by the Am Chem Soc
(NASA-TM-79185 E-052) Avail NTIS HC A02/MF A01 CSCL 20K

Maintenance costs associated with the transmissions and drive train greatly increase the maintenance burden and failure risk. Detection measurements fall under two general categories of vibration and particle detectors. The latter are more amenable to tracking wear. Wear debris analysis can supply a great deal of information such as particle concentration rate of change in concentration composition particle size and shape principal metals etc. It is not economically feasible to monitor all variables. At least one role of the lubrication and wear specialist is to provide guidance in selecting the most appropriate variables to monitor. RES

DYNAMIC STRUCTURAL ANALYSIS WITH SUBSTRUCTURES Interim Technical Report, Sep - Dec 1978

Jasbir S Arora and Duc T Nguyen Dec 1978 34 p refs
(Contract DAAK11-77-C-0023)

(AD-A065937 TR-46) Avail NTIS HC A03/MF A01 CSCL 13/13

A method for dynamic structural analysis with substructures and the subspace iteration is developed. The method does not use component mode synthesis concepts. Therefore eigenproblem for each substructure is not solved. The method uses only substructural stiffness matrices and the mass matrix for each finite element of the system. The mass matrix for the entire structure or any of its substructures need not be computed. However efficiency of the method is improved when mass matrix for the entire structure is computed and saved in the computer core. Unlike component mode substitution methods, no approximating assumptions are made. Thus natural frequencies and mode shapes for the finite element model employed are the same with or without the substructuring algorithm. This is demonstrated by computing first ten natural frequencies and the corresponding mode shapes for an open truss helicopter tail-boom structure. Author (GRA)

ANALYZE ANALYSIS OF AEROSPACE STRUCTURES WITH MEMBRANE ELEMENTS Final Report, May - Aug 1978

Vipperla B Venkayya and Victoria A Tischler Dec 1978 117 p refs
(AD-A065633 AFFDL-TR-78-170) Avail NTIS HC A06/MF A01 CSCL 13/13

This report contains documentation for the program ANALYZE. The program library consists of a bar, a membrane triangle, a quadrilateral and a shear panel. The equations of finite element analysis, element formulations, program organization and subroutine descriptions provide a comprehensive theoretical background for the program. The input and output instructions together with the sample problem and the results should provide adequate information for the use of this program. ANALYZE is an in-house program and can be used on INTERCOM for problems up to 150 to 200 degrees of freedom and a comparable number of elements. This program is extremely useful in training engineers in the use of finite element programs in the development of finite element models of large aerospace structures and in research in structural analysis and optimization. DETECTION OF LOW FLYING AIRCRAFT BY ACOUSTICAL MEANS

J Schiller Jul 1978 52 p refs In GERMAN ENGLISH summary Sponsored by Bundesmin fuer Verteidigung (Rept-8-78) Avail NTIS HC A04/MF A01

Detection and location of very low flying aircraft is often impossible or at least very difficult to achieve by radar. The idea of filling this detection gap by making use of the acoustic noise radiated from an aircraft is considered. Some general thought is given to the problem of acoustically measuring parameters of targets that move with speeds close to sonic

speed. Some preliminary experiments allow a rough estimate of the detection range and bearing measurement errors to be made. Author (ESA)

APPLICATION OF ELECTRON-BEAM WELDING TO AVIATION PRODUCTION

Henryk Zatyka In its Transl on Eastern Europe Sci Affairs, No 625 (JPRS-73266) 20 Apr 1979 p 22-36 refs Transl into ENGLISH from Tekhn Lotniczna i Astronautyczna (Warsaw) no 1 Jan 1979 p 29-33

Avail NTIS HC A03/MF A01

An electron beam furnace used in the serial production of small turbines and turbocompressors for nonaviation production in Poland, was modified to melt the metal required for welding aircraft turbine engine parts. Technical parameters of the welding process were established and instrumentation to insure high output was developed and executed. Metallurgical and strength tests were conducted on welded joints and conditions for welding a turbine were established which would insure a weld without faults and of the required strength. Five turbine disks were welded and after further mechanical working were subjected to long term tests (2,000 hours). A R H

A VECTOR-CONTINUOUS LOADING CONCEPT FOR AERODYNAMIC PANEL METHODS
 William B Kemp Jr May 1979 39 p refs
 (NASA-TM-80104) HC A03/MF A01 CSCL 01A

An approach to the reduction of discretization errors in aerodynamic panel methods is presented The approach is based on preventing the occurrence of induced velocity singularities at panel slope discontinuities by maintaining continuity of the velocity jump vector across the panels The approach was implemented in a two-dimensional incompressible panel method formulation and evaluated by application to several external and internal flow problems The method is shown to exhibit a second order accuracy trend and to produce smaller errors with velocity component boundary conditions imposed on the real flow than with equipotential boundary conditions imposed on the imaginary flow behind the panels For flows around airfoil sections with either sharp or blunt trailing edges the method gives excellent agreement with results from a well developed finite difference method The method is well behaved and is insensitive to irregularities in panel size distribution S E S

HELICOPTER ROTOR AIRFOIL Patent Application
 Gene J Bingham inventor (to NASA) Filed 6 Mar 1979 21 p
 (NASA-Case-LAR-12396-1 US-Patent-Appl-SN-017889) Avail NTIS HC A02/MF A01 CSCL 01A

An airfoil which has particular application to the blade or blades of rotor aircraft and aircraft propellers is presented The airfoil thickness distribution camber and leading edge radius are shaped to locate the airfoil crest at a more aft position along the chord and to increase the freestream Mach number at which sonic flow is attained at the airfoil crest The reduced slope of the airfoil causes a reduction in velocity at the airfoil crest at lift coefficients from zero to the maximum lift coefficient The leading edge radius is adjusted so that the maximum local Mach number at 1.25 percent chord and at the designed maximum lift coefficient is limited to about 0.48 when the Mach number normal to the leading edge is approximately 0.20 The lower surface leading edge radius is shaped so that the maximum local Mach number at the leading edge is limited to about 0.29 when the Mach number normal to the leading edge is approximately 0.20 The drag divergence Mach number associated with the airfoil is moved to a higher Mach number over a range of lift coefficients resulting in superior aircraft performance NASA

An inlet suitable for a turbine engine in a STOL VTOL or CTOL aircraft is described. A circumferentially extended slot is provided in the inner surface of the air inlet at the windward side and downstream of the throat region. The slot communicates with a circumferential plenum chamber formed in the front of the air inlet just behind the lip. Circumferentially extending rows of apertures are provided on the lip establishing two sets of apertures spaced circumferentially away from the slot in opposite directions. The slot removes the boundary layer from the critical portion of the diffuser to minimize or eliminate flow pressure loss or separations resulting from diffusion or turning. The apertures are in a region of low static pressure on the lip of the inlet and serve as a source of suction to cause air flow into the slot.

A VARIATIONAL THEOREM FOR LAMINATED COMPOSITE PLATES OF NONLINEAR MATERIALS AND APPLICATIONS TO POSTBUCKLING Ph D Thesis
 Robert Elon Anderson 1979 206 p
 Avail Univ Microfilms Order No 7912335

A prediction capability for the response under edge loading of anisotropic layered flat plates composed of orthotropic laminae possessing nonlinear stress-strain characteristics was investigated. Confidence in the results presented for the prediction of laminated plate stress-strain response and the elasto-plastic postbuckling of one type of simply supported square laminated plate under axial compression loading is obtained by comparison of predictions based on current theory analysis and solution procedures with reliable experimental data and limiting case (isotropic and orthotropic) solution results. It was concluded that advanced composite laminates consisting of arbitrarily oriented orthotropic filamentary laminae are tractable by variational analysis and that such laminates acting as uniaxially compressed postbuckled plates are as fundamentally sensitive to material nonlinearity as their conventional metal counterparts. A COOLING SYSTEM FOR AN AIRCRAFT HAVING A CRUISE RANGE FROM MACH 2 TO MACH 8 Patent Application
 Pierce L Lawing and Laverne L Pagel inventors (to NASA) (McDonnell Aircraft Co) Filed 31 Jan 1979 21 p
 (NASA-Case-LAR-12406-1 US-Patent-Appl-SN-008210) Avail NTIS HC A02/MF A01 CSCL 01C

The necessity of shielding an aircraft airframe constructed of material such as aluminum is eliminated by using a system which provides total cooling for an airframe designed to fly in the speed range of Mach 2 to Mach 8. Cooling is accomplished by passing a coolant through the aircraft airframe the coolant acting as a carrier to remove heat from the airframe. The coolant is circulated through a heat pump and a heat exchanger which together extract essentially all of the added heat from the coolant. The heat is transferred to the aircraft fuel system via the heat exchanger and the heat pump. The heat extracted from the coolant is utilized to power the heat pump. The heat pump is associated with a power turbine mechanism which is also driven by the extracted heat. The power turbines are utilized to drive various aircraft subsystems the compressor of the heat pump and provide engine cooling. This system is accomplished with a small increase in aircraft weight and a total result of a small increase in performance. NASA

FEASIBILITY AND COST EFFECTIVENESS OF AIRBORNE TIRE PRESSURE INDICATING SYSTEMS Final Report, Sep 1977 - Sep 1978
 R Suiter Oct 1979 122 p refs
 (Contract DOT-FA77WA-4070)
 (AD-A065513 FAA-RD-78-134-1) Avail NTIS HC A06/MF A01 CSCL 01/3

The wheel mounted pressure readout gauges and devices and cockpit tire pressure warning indicators for air carrier transports having 6 10 and 18 wheels are studied. Typical wheel mounted readout devices and eleven conceptual cockpit indicating systems are discussed. Information on accuracy temperature

compensation requirements weight installation cost system cost and system maintenance cost is provided. A study of tire failures is made for 1973-1976 identifying rate of tire failures and aircraft damage costs resulting from tire failures. Sixty-five percent of airframe damage cost is related to underinflation - induced or related tire failures which may be avoided by a properly designed tire pressure indicating system. Average airframe damage cost per departure for each study aircraft based on actual airline data is presented with comments on delay and cancellation costs. Aircraft damage costs and tire maintenance costs may be avoided are compared to tire pressure indicating system life cycle costs to show that tire pressure systems are basically feasible but marginally cost effective aircraft testing of promising systems is recommended. The symposium was sponsored by the Air Force Flight Dynamics Laboratory as part of an effort to revise MIL-F-8785B Military Specification Flying Qualities of Piloted Airplanes. Flying Qualities specialists were brought together from industry government agencies and university. Topics for discussion were (1) experience and problems with MIL-F-8785B (2) revisions to MIL-F-8785B currently proposed by AFFDL/FGC (3) a new format for the flying qualities requirements, and (4) future requirements in general. Full-length and informal papers were solicited to address any of the preceding topics. In addition working sessions were organized to discuss the current revisions and future requirements from the viewpoints of different technical disciplines. This report contains the papers and summaries of the working sessions as submitted by the authors. GRA

The objective of the work performed under this contract was to demonstrate selective reinforcement of a cast magnesium housing by the use of high-modulus FP fibers via casting technology. A series of housing element specimens were designed fabricated and tested to evaluate the application of state-of-the-art technology to the fabrication of a full-scale, fiber-reinforced metallic transmission housing. Several typical housing section specimens were fabricated and tested to determine material properties. These properties were compared with predicted values to develop the technology and analytical capability for the application of selective reinforcement of a full-scale helicopter transmission housing, with the final objective of reducing system deflections, noise, and vibration. An analytic study was conducted to assess the suitability of a conformable rotor for satisfying the requirements of a typical Army mission. A conformable rotor blade is a blade designed to produce changes in blade twist with azimuth and flight condition which improve performance and reduce rotor loads. This study quantified the performance advantages and rotor system load reductions possible with a conformable rotor by designing blades suited for the UH-60A mission and comparing calculated rotor behavior with that of the UH-60A rotor. Relative to the UH-60A design the conformable blade employs a four-to-one reduction in torsional stiffness over the outer half of the blade a reduction in built-in twist from -16 to -12 degrees an increase from 20 to 30 degrees in tip sweep and reflex tab deflection inboard of the 80-percent radial position. This design produces elastic response which increase twist in hover and reduces advancing blade twist in forward flight GRA

The various measurements and equipment necessary to determine the aerodynamic performance of an aircraft (stationary, normal flight maneuvering) are discussed. Techniques developed for the Tornado test flight program are presented. Measurements corresponding measurement parameters, and theoretical considerations are given. For this aircraft, lift and drag characteristics were determined over a complete range of attack angles with an accuracy of between 4 percent and 5 percent. Fully automated data handling techniques permit the results to be analyzed in minimum time. Author (ESA)

This report covers the second phase of the subject contract whose first phase was the study of a hierarchical form of a fault-tolerance data communication network. The second phase task involved an examination of the Navy's 3-M (maintenance material management) data base to see if any evidence was readily available or easily extractable to affirm or refute the hypotheses underlying fault-tolerant system design. A large volume of aggregate data was examined for three aircraft types the E-2C the P-3C, and the S-3A. Several broad conclusions were reached with respect to the fault-tolerant system design hypotheses. Some observations and interferences are presented to conclude this report. Author (GRA)

ADVANCED LOW EMISSIONS CATALYTIC COMBUSTOR PROGRAM AT GENERAL ELECTRIC
 W J Dodds *In* NASA Lewis Res Center Premixed Prevaporized Combustor Technol Forum 1979 p 215-227 refs

Avail NTIS HC A12/MF A01 CSCL 21E

The Advanced Low Emissions Catalytic Combustors Program (ALECC) is being undertaken to evaluate the feasibility of employing catalytic combustion technology in aircraft gas turbine engines as a means to control emission of oxides of nitrogen during subsonic stratospheric cruise operation. The ALECC Program is being conducted in three phases. The first phase, which was completed in November 1978, consisted of a design study to identify catalytic combustor designs having the greatest potential to meet the emissions and performance goals specified. The primary emissions goal of this program was to obtain cruise NO emissions of less than 1g/kg (compared with levels of 15 to 20 g/x obtained with current designs). However, good overall performance and feasibility for engine development were heavily weighted in the evaluation of combustor designs. G Y

Avail NTIS HC A12/MF A01 CSCL 21E

Phase 1 of the Lean Premixed-Prevaporized Combustor Design Study is a nine month analytical study effort with no experimental or testing activities included. The program has the objective to design and analyze advanced combustor concepts with features for fuel premixing and prevaporization upstream of the combustion zone for use in future subsonic aircrafts with features for fuel premixing and prevaporization upstream of the combustion zone for use in future subsonic aircraft engines. All of the designs also embody some form of variable geometry for combustor flow modulation. The primary criterion for these designs is low oxides of nitrogen emissions at stratospheric cruise conditions.

Four combustor concepts are being designed for the NASA/GE Energy Efficient Engine (EEE) envelope and cycle. Current status of the program is that the four concepts sized for the EEE were designed and are currently undergoing analysis and evaluation. G Y

The F100 Multivariable control synthesis (MVCS) program was aimed at demonstrating the benefits of LGR synthesis theory in the design of a multivariable engine control system for operation throughout the flight envelope. The advantages of such procedures include (1) enhanced performance from cross-coupled controls (2) maximum use of engine variable geometry and (3) a systematic design procedure that can be applied efficiently to new engine systems. The control system designed under the MVCS program, for the Pratt & Whitney F100 turbofan engine is described. Basic components of the control include (1) a reference value generator for deriving a desired equilibrium state and an approximate control vector, (2) a transition model to produce compatible reference point trajectories during gross transients (3) gain schedules for producing feedback terms appropriate to the flight condition and (4) integral switching logic to produce acceptable steady-state performance without engine operating limit exceedance. Ten candidate modified nickel-aluminide coatings were developed using the slip pack process. These coatings contain additives such as silicon, chromium and columbium in a

nickel-aluminum coating matrix with directionally solidified MAR-M200 + Hf as the substrate alloy. Following a series of screening tests which included strain tolerance, dynamic oxidation and hot corrosion testing, the Ni-19Al-1Cb (nominal composition) coating was selected for application to the internal passages of four first-stage turbine blades. Process development results indicate that a dry pack process is suitable for internal coating application resulting in 18 percent or less reduction in air flow. Coating uniformity based on coated air-cooled blades was within + or - 20 percent. Test results show that the presence of additives (silicon, chromium or columbium) appeared to improve significantly the ductility of the NiAl matrix. However, the environmental resistance of these modified nickel-aluminides were generally inferior to the simple aluminides. A R H

(Contract NAS3-20041, R79AEG288)
(NASA-CR-159545) Avail NTIS HC A11/MF A01 CSCL 21E

A design technology study was performed to identify a high speed multistage variable geometry fan configuration capable of achieving wide flow modulation with near optimum efficiency at the important operating condition. A parametric screening study of the front and rear block fans was conducted in which the influence of major fan design features on weight and efficiency was determined. Key design parameters were varied systematically to determine the fan configuration most suited for a double bypass variable cycle engine. Two and three stage fans were considered for the front block. A single stage core driven fan was studied for the rear block. Variable geometry concepts were evaluated to provide near optimum off design performance. A detailed aerodynamic design and a preliminary mechanical design were carried out for the selected fan configuration. Performance predictions were made for the front and rear block fans. Author

SIMULATED PROPELLER SLIPSTREAM EFFECTS ON A SUPERCRITICAL WING

H. Robert Welge and James P. Crowder, Jun 1978, 72 p, refs.
(Contract NAS2-9472)
(NASA-CR-152138) Avail NTIS HC A04/MF A01 CSCL 21E

To quantify the installed performance of high speed (M = 0.8) turboprop propulsion systems, an experimental program designed to assess the magnitude of the aerodynamic interference of a propeller slipstream on a supercritical wing has been conducted. The test was conducted in the NASA Ames 14-foot wind tunnel. An ejector-nacelle propeller slipstream simulator was used to produce a slipstream with characteristics typical of advanced propellers presently being investigated. A supercritical wing-body configuration was used to evaluate the interference effects. A traversing total pressure rake was used to make flow field measurements behind the wing and to calibrate the slipstream simulator. The force results indicated that the interference drag amounted to an increase of ten counts or about 3% of the wing-body drag for a two engine configuration at the nominal propeller operating conditions. However, at the higher swirl angles (11 deg vs 7 deg nominally) the interference drag was favorable by about the same magnitude. Author

OPTICAL IN SITU VERSUS PROBE MEASUREMENTS OF NITRIC OXIDE CONCENTRATION AS A FUNCTION OF AXIAL POSITION IN A COMBUSTOR EXHAUST Final Report, 21 Jul - 27 Aug 1977

J D. Few, R J. Bryson and H S. Lowry III, AEDC, Mar 1979, 37 p, refs.
(AD-A067329, AEDC-TR-78-32) Avail NTIS HC A03/MF A01 CSCL 21/2

Nitric oxide (NO) concentration was measured at three axial stations (6.5, 12 and 25 nozzle diameters downstream of a combustor nozzle exit) in a jet engine combustor exhaust by a

gas-sampling probe in conjunction with conventional gas analyzers and an optical resonance absorption technique. The gas analyzer system permitted measurements of NO, NO sub x, CO CO sub 2 and C sub x H sub y (total hydrocarbons) whereas the optical absorption technique permitted measurement of NO only. The combustor was exhausted into a test cell of slightly less than atmospheric pressure and was operated at an inlet air temperature of 589 K, a total pressure of 344.3 kPa, and a fuel-to-air ratio (f/a) of 0.02. A multiprobe rake was used to acquire emissions, total pressure and temperature and static pressure data at the measurement stations. The measurements of total pressure, total temperature and measured static pressure were used to determine static temperature and pressure profiles at each measurement station which are required for determining NO concentration by the optical absorption technique. This report briefly reviews the results of the Kaman Aviodyne/AEDC experimental program funded by DNA. The purpose of this program was to develop an experimental technique that could be used to define the nuclear-blast-induced distortion at the inlet/engine interface of aircraft and air-breathing missiles. The results of the test program have been evaluated as has the potential impact of these results on other air-breathing engines with inlets having different L/D values. Author (GRA)

REGRESSION SIMULATION OF TURBINE ENGINE PERFORMANCE ACCURACY IMPROVEMENT (TASK 4) Final Technical Report, 30 Sep 1977 - 30 Sep 1978

Joseph A Sabatella Jr and James S Johnson 30 Sep 1978 96 p refs

(Contract F33615-77-C-2109)

(AD-A066398, PWA-FR-10608 AFAPL-TR-78-103) Avail NTIS HC A06/MF A01 CSDL 21/5

The Regression Simulation of Turbine Engine Performance (RSTEP) Task IV program was an analytical study to identify and evaluate approaches to improve the accuracy of regression surfaces for use in TEVCS/ARES procedures. The Central Composite Design (CCD) data selection pattern was studied and found to be a flexible, accurate and economical alternative to the orthogonal Latin Square design selector. The impact of the number of independent variables and the number of data points was systematically investigated. Two methodologies which provided significant improvement in the accuracy of the regression surfaces were also identified. Author (GRA)

BRITTLE MATERIALS DESIGN, HIGH TEMPERATURE GAS TURBINE CERAMIC TURBINE ROTOR TECHNOLOGY Interim Report, 1 Oct 1977 - 31 Mar 1978

Arthur F McLean and Robert R Baker Feb 1979 87 p refs (Contract DAAG46-71-C-0162)

(AD-A067176 AMMRC-TR-79-11 IR-13) Avail NTIS HC A05/MF A01 CSDL 11/2

This report contains progress during the last six months and a summary of earlier progress on the DOE supported programs within the joint DARPA/DOE Brittle Materials Design High Temperature Gas Turbine Program and constitutes the final report of work under DOE funds. A separate report will cover the progress on the DARPA supported Ceramic Turbine Testing Program. The summary of previous work supported by DOE includes progress on reaction bonded and hot pressed silicon nitride materials technology. Several NDE techniques were considered for the detection of flaws in complex-shaped silicon nitride components. Improvements to the hot press bonding process resulted in a significant improvement in the yield of flaw-free hot press bonded rotors. MOR and cold spin tests of

rotor blade rings revealed the presence of undetected subsurface flaws in both the blades and the rim. Blade bend testing indicated that blade strength degraded during hot press bonding. During this reporting period, an investigation of hot press bonding temperatures and time at temperature defined a region of zero microstructural and strength degradation. This study involved 19 hot press bondings from which curves were generated defining the changes in color, porosity, hardness, phase and strength as a function of time and temperature. GRA

HANDLING QUALITIES OF LARGE FLEXIBLE CONTROL-CONFIGURED AIRCRAFT Semiannual Status Report, 1 Jan - 30 Jun 1979

Robert L Swaim 22 Jun 1979 10 p refs

(Grant NSG-4018)

(NASA-CR-158694) Avail NTIS HC A02/MF A01 CSDL 01C

The approach to an analytical study of flexible airplane longitudinal handling qualities was to parametrically vary the natural frequencies of two symmetric elastic modes to induce mode interactions with the rigid body dynamics. Since the structure of the pilot model was unknown for such dynamic interactions, the optimal control pilot modeling method is being applied and used in conjunction with pilot rating method. J A M

CAPTURING AND TRACKING PERFORMANCE OF THE HORIZONTAL GUIDANCE AND CONTROL SYSTEMS OF THE TERMINAL CONFIGURED VEHICLE

Charles E Knox Jun 1979 35 p refs

(NASA-TM-80068 L-11442) Avail NTIS HC A03/MF A01 CSDL 01C

A twin-jet commercial transport equipped with digital navigation guidance and control systems and advanced electronic display system was used for airborne operational research. The results of flight tests which evaluated a second-order horizontal-path guidance control law and the autopilot and airplane response are presented. This evaluation was accomplished through analysis of recorded flight data and through pilot opinion of the airplane maneuvers during automatic path-capture scenarios and path tracking. Four different path captures were flown at a ground speed of approximately 160 knots and repeated at approximately 300 knots. Path tracking tracking error was measured in terms of cross track error along two paths: one at cruise speeds and one at airport-terminal-area speeds. The path tracking accuracy and the smoothness of the airplane maneuvers were judged satisfactory for high speeds; however, at lower speeds the control law design should be improved so that tracking will be more accurate for operations in the airport terminal area. Revisitation and extension of classical sampled data approaches for the analysis of discretely controlled continuous systems is the focus of this report. A review of basic linear analysis topics required to support later developments is given. These topics include Laplace z- and advanced z-transform facts, partial fraction expansion, data holds and the switch decomposition technique. Extension of switch decomposition for the vector signal case is given. A new direct transform domain approach for analyzing two-rate sampled systems is developed. This approach also applies for multi-rate sampled systems in restricted circumstances. Utility of this approach resides in its operator notation and conventions for manipulation in connection with vector block diagram algebra. This, in turn, expedites development of pulse transfer functions and of response recursion relations.

for multivariable closed-loop systems This is accomplished without resorting to the more complicated switch decomposition method Multi-rate sampling analysis procedures are used to sharpen the concept of frequency response for discretely excited, continuous systems All methods of analysis presented in this report are closed-form and exact in that no approximation is required in the mathematical development of any result GRA

OPTIMAL PLACEMENT OF REGIONAL FLIGHT SIMULATORS M S Thesis

David R VanDenburg and Jon D Veith Sep 1978 98 p refs (AD-A060450 AFIT-LSSR-18-78B) Avail NTIS HC A05/MF A01 CSCL 05/9

Due to the depletion of petroleum resources and increasing aircraft operating costs, inflight simulators are assuming a larger role in aircrew training. Simultaneously increased simulator acquisition and support costs have resulted in fewer simulator systems. Consequently a regional simulator deployment plan is often used. This plan involves the placement of simulator systems at a number of central locations and transporting students to these locations to accomplish their required training. This research attempted to develop a mathematical model to assist in the placement decision. The model was developed however, a suitable computer algorithm could not be found to solve the resulting equations. Consequently a model was developed and used to provide suggested student allocation schedules for predetermined simulator location plans. It was concluded that mathematical techniques could be employed to assist in the placement decisions. In addition it is believed that future improvements in computer software could produce an algorithm capable of solving the model originally developed. Author (GRA)

DYNAMIC EVALUATION OF EXPERIMENTAL INTEGRAL FUEL-TANK SEALANTS, PART 2 Final Technical Report, Jul 1977 - Jun 1978

William R Mallory Wright-Patterson AFB Ohio AFML Nov 1978 41 p

(Contract F33615-76-C-5253 AF Proj 2421 AF Proj 7340) (AD-A066592 SRL-6901-Pt-2 AFML-TR-77-152-Pt-2) Avail NTIS HC A03/MF A01 CSCL 11/1

An exploratory development program has been performed to investigate and evaluate experimental integral fuel-tank sealant materials under laboratory conditions which closely simulate those of actual aircraft integral fuel tanks during flight. As part of this effort a unique facility has been designed and fabricated for the evaluation of a variety of joint configurations. The facility consists primarily of a biaxial stress machine in which temperature, pressure, and vibrational strain can be programmed for automatic operation. Specimens can be strained longitudinally and torsionally to simulate actual flight conditions. Frequency and amplitude of the strains can be independently set and recorded. Simulated fuel-tank and environmental pressure can also be adjusted independently. Early difficulties with sealant-failure detection and with undesirable thermal strains have been largely resolved and partial evaluation of continuous-fillet specimens utilizing one sealant material has been performed. A second evaluation apparatus is now under construction. Author (GRA)

BROAD-BAND TRANSDUCERS FOR NONDESTRUCTIVE INSPECTION OF AERONAUTICAL COMPONENTS

Jean-Francois deBellevall *In* AGARD Non-Destructive Inspection Methods for Propulsion Systems and Components Apr 1979 10 p refs *In* FRENCH ENGLISH summary

Avail NTIS HC A08/MF A01

For ultrasonic nondestructive inspection of aeronautical components it is mandatory to detect defects both smaller and smaller and nearer and nearer the surface of these components. The quantitative evaluation of these defects allowing a definition of their mechanical consequences must also be improved. This requires the use of more sensitive ultrasonic transducers, with a larger bandwidth. The main method used at present to increase the bandwidth of piezoelectric transducers entails an important decrease of their sensitivity. It is based on the damping of the piezoelectric wafer on its rear face. Suggested to use instead damping by a multilayer front face which allows a simultaneous increase of both sensitivity and bandwidth. In order to study the feasibility of this process a computing program was developed to calculate the propagation of a wave through several layers of different thicknesses. This program makes it possible to optimize the characteristics (impedance and thickness) of the various layers making up the transducer. Comparisons with actual transducers allowed the validation of this theoretical model. G Y

HC A10/MF A01 CSCL 01/3

The purpose of this program is to provide generalized crack growth tracking procedures for transport/bomber aircraft. The study was composed of three major tasks: (1) an evaluation of the effects of usage parameters on crack growth; (2) the development of generalized tracking procedures; and (3) an evaluation of the techniques for implementing the individual aircraft tracking program. The KC-135A tanker was selected as the baseline aircraft for this study. Approximately thirty tests were conducted to experimentally verify predictions made from analyses and to determine the crack growth rate characteristics of the specimen material. The results of the parametric and variability studies were used to develop analysis schemes for predicting the effects of usage variations on crack growth. Four tracking procedures were evaluated: (1) pilot logs with the use of parametric crack growth rate data; (2) pilot logs with the use of parametric stress exceedance data; (3) the Mechanical Strain Recorder (MSR); and (4) the crack growth gauge. The implementation of each tracking procedure was evaluated by developing a cost model to study relative life cycle costs. Author (GRA)

A steady state exhaust emissions data base was developed. This data base consisted of current production baseline emissions characteristics, lean-out emissions data, effects of leaning-out the fuel schedule on cylinder head temperatures, and data showing ambient effects on exhaust emissions and cylinder head temperatures. The engine operating with its current full-rich production fuel schedule did not meet the proposed Environmental Protection Agency (EPA) standard for carbon monoxide (CO) under sea level standard-day conditions. The engine did, however, meet the proposed EPA standards for unburned hydrocarbons (HC) and oxides of nitrogen (NOx) under the same sea level test conditions. The results of testing the engine under different ambient conditions (hot day) were also presented, and these results showed a trend toward higher levels of emissions output for CO and HC while producing slightly lower levels of NOx. ONE NOISE OF THREE SUPERSONIC HELICAL TIP SPEED PROPELLERS IN A WIND TUNNEL
 James H Dittmar Robert J Jeracki and Bernard J Blaha 1979 66 p refs Presented at 97th Meeting of the Acoustical Soc of Am, Cambridge Mass 11-15 Jun 1979
 (NASA-TM-79167 E-030) Avail NTIS HC A04/MF A01 CSCL 20A

Three supersonic helical tip speed propellers were tested in the NASA Lewis 8- by 6-foot wind tunnel. This is a perforated-wall

wind tunnel but it does not have acoustic damping material on its walls. The propellers were tested at tunnel through flow Mach numbers of 0.6 0.7 0.75 0.8 and 0.85 with different rotational speeds and blade setting angles. The three propellers which had approximately the same aerodynamic performance incorporated different plan forms and different amounts of sweep and yielded different near field noise levels. The acoustically designed propeller had 45 deg of tip sweep and was significantly quieter at M = 0.8 cruise than the straight bladed propeller. The intermediate 30 deg tip sweep propeller which was swept for aerodynamic purposes, exhibited noise that was between the other two propellers. Noise trends with varying helical tip Mach number and blade loading were also observed. Author

ASSESSMENT AT FULL SCALE OF NOZZLE/WING GEOMETRY EFFECTS ON OTW AERO-ACOUSTIC CHARACTERISTICS
 D Groesbeck and U vonGlahn 1979 31 p refs
 (NASA-TM-79168 E-031) Avail NTIS HC A03/MF A01 CSCL 20A

The effects on acoustic characteristics of nozzle type and location on a wing for STOL engine over-the-wing configurations are assessed at full scale on the basis of model-scale data. Three types of nozzle configurations are evaluated: a circular nozzle with external deflector mounted above the wing; a slot nozzle with external deflector mounted on the wing; and a slot nozzle mounted on the wing. Nozzle exhaust plane locations with respect to the wing leading edge are varied from 10 to 46 percent chord (flaps retracted) with flap angles of 20 (takeoff altitude) and 60 (approach altitude). Perceived noise levels (PNL) are calculated as a function of flyover distance at 152 m altitude. From these plots static EPNL values defined as flyover relative noise levels are calculated and plotted as a function of lift and thrust ratios. From such plots the acoustic benefits attributable to variations in nozzle/deflector/wing geometry at full scale are assessed for equal aerodynamic performance. Author

AN EXPERIMENTAL INVESTIGATION OF THE EFFECT OF ROTOR TIP SHAPE ON HELICOPTER BLADE-SLAP NOISE
 Danny R Hoad May 1979 464 p refs Prepared in cooperation with Army Res and Technol Labs Hampton Va
 (NASA-TM-80066) Avail NTIS HC A20/MF A01 CSCL 20A

The effect of tip-shape modification on blade-vortex interaction-induced helicopter blade-slap noise was investigated. The general rotor model system (GRMS) with a 3.148 m (10.33 ft) diameter four-bladed fully articulated rotor was installed in the Langley V/STOL wind tunnel. The tunnel was operated in the open-throat configuration with treatment to improve the semi-anechoic characteristics of the test chamber. Based on previous investigation four promising tips (ogee sub-wing 60 deg swept-tapered and end-plate) were used along with a standard square tip as a baseline configuration. Aerodynamic and acoustical

data concerning the relative applicability of the various tip configurations for blade-slap noise reduction are presented without analysis or discussion A R H

THERMOSPHERIC PROPAGATION OF SONIC BOOMS FROM THE CONCORDE SUPERSONIC TRANSPORT Final Report

John H Gardner and Peter H Rogers 14 Feb 1979 83 p
 refs
 (AD-A067201 NRL-MR-3904) Avail NTIS
 HC A05/MF A01 CSCL 20/1

A nonlinear theory for the long-range propagation of sonic booms through the thermosphere has been developed. A realistic atmosphere is employed and consideration is given to such factors as nonlinear stretching and decay of the wave, the effects of the caustic, the linear acoustic attenuation and the increase in Mach number due to the decreasing density at high altitudes. Detailed results are presented for the case of the Concorde SST in straight level and steady flight at 17.5 km and a velocity of Mach 2. We predict maximum ground level pressures of 0.3 Pa with an N-wave period of about 10 seconds. The sound level is a minimum along the flight track with the maximum signal strength occurring about 300 km off the flight track. The strongest received signal travels initially downward and reflects off the surface of the ocean to the thermosphere. The wave turns around at an altitude of 160 km and is returned back to the ground at a horizontal distance of 320 km from the launch point. The acoustic Mach number of the wave never exceeds 0.2. Ninety percent of the wave's energy is attenuated below 100 km with 99% attenuated by the time the wave reaches the turning point. GRA

THE APPLICATION OF STRUCTURED DESIGN AND DISTRIBUTED TECHNIQUES TO AVIONICS INFORMATION PROCESSING ARCHITECTURES

Louis A Naglak and William M Norr /in AGARD Tech for Data Handling in Tactical Systems, 2 Apr 1979 17 p refs

Avail NTIS HC A16/MF A01

Structured design principles were used in the formulation of a methodology for systems design and applied to the definition of avionics processing architectures. The task was an effort to take advantage of technology advances in the computer field and structured support in software to reduce life cycle costs of avionics. A core avionics was defined and the design constraint imposed upon it discussed. The structured procedure and the way in which it was meant to take advantage of technology was explained. Impact of standard is presented and also a specified scheme for implementation. Alternatives for development and acquisition methods and contracting for a generic avionics score are presented. J A M

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl 113)*

SEPTEMBER 1979

Typical Subject Index Listing

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

Air pollutant emission factors for military and civil aircraft [PB-292520/4] N79-25567

AIR TO SURFACE MISSILES

Evaluation of ground-launch firings for the improved 2.75-inch rocket [AIAA PAPER 79-1297] A79-39027

AIR TRAFFIC CONTROL

A family of air traffic control radars A79-38532

The time budget as a criterion for the workload of air traffic controllers [MBB-UPE-1353-0] N79-23943

Discrete address beacon system. A bibliography with abstracts [NTIS/PS-79/0244/8] N79-23945

AIR TRANSPORTATION

Propelled lighter-than-air vehicles [GPO-43-457] N79-23925

The airport performance model. Volume 1: Extensions, validations, and applications [AD-A062863] N79-25040

AIRBORNE/SPACEBORNE COMPUTERS

Informativeness and effectiveness of digital command-generating devices --- flight vehicle onboard computers A79-36588

The effects of low-level wind shear on the approach and go-around performance of a landing jet aircraft [SAE PAPER 790568] A79-36708

A general aviation flight test application of the on-board computer [SAE PAPER 790583] A79-36718

Exploring team avionics systems by simulation A79-38882

Aerospace computer systems. Part 1: Avionics applications, volume 2. A bibliography with abstracts [NTIS/PS-79/0312/3] N79-23959

Aerospace computer systems. Part 1: Avionics applications, volume 3. A bibliography with abstracts [NTIS/PS-79/0313/1] N79-23960

AIRCRAFT

Polar lift and drag determination during flight tests [MBB-UPE-1410-0] N79-24986

Aircraft air pollution emission estimation techniques, ACEE [AD-A067262] N79-25550

AIRCRAFT ACCIDENT INVESTIGATION

Crashworthiness analysis of field investigation of business aircraft accidents [SAE PAPER 790587] A79-36721

AIRCRAFT ACCIDENTS

Crash-resistant fuel systems for general aviation aircraft [SAE PAPER 790592] A79-36726

Safety hazard of aircraft icing N79-23916

AIRCRAFT ANTENNAS

Fuselage-mounted antenna code: User's manual [AD-A065587] N79-24215

Wing-mounted antenna code: User's manual [AD-A065589] N79-24216

An iterative approach for computing an antenna aperture distribution from given radiation pattern data [AD-A065590] N79-24217

AIRCRAFT BRAKES

Advanced braking controls for business aircraft [SAE PAPER 790599] A79-36731

Model study of aircraft disk brakes A79-38816

AIRCRAFT CARRIERS

SUBJECT INDEX

AIRCRAFT CARRIERS

Air pollutant emission factors for military and civil aircraft
[PB-292520/4] N79-25567

AIRCRAFT COMMUNICATION

An optical-fiber multiterminal data system for aircraft A79-36484

Some possible applications of identification theory techniques in telemetry --- for aircraft communication A79-36589

Air Force Space Laser Communications A79-38706

The F-16 RIW program --- Reliability Improvement Warranty A79-39889

Map-of-the-earth communication program for helicopters [AD-A063089] N79-24232

AIRCRAFT COMPARTMENTS

An experimental study of propeller-induced structural vibration and interior noise [SAE PAPER 790625] A79-36753

AIRCRAFT CONFIGURATIONS

The Lockheed C-5: Case study in aircraft design --- Book A79-36646

Spin flight research summary [SAE PAPER 790565] A79-36706

The Learjet 'Longhorn' series - The first jets with winglets [SAE PAPER 790581] A79-36716

Project Sunrise --- solar-powered aircraft flight demonstration [AIAA PAPER 79-1264] A79-39010

The impact of operational requirements on V/STOL propulsion concept selection [AIAA PAPER 79-1283] A79-39018

V/STOL aircraft configuration effects on exhaust gas ingestion [AIAA PAPER 79-1284] A79-39019

The impact of alternate fuels on aircraft configuration characteristics --- military aircraft [AD-A066983] N79-25244

AIRCRAFT CONSTRUCTION MATERIALS

Development of an aircraft composite propeller [SAE PAPER 790579] A79-36714

Installation for studying fatigue strength of materials in acoustic loading --- for aircraft skins A79-39070

AIRCRAFT CONTROL

The results of synthesizing and evaluating potential solutions for Multi-Function Inertial Reference Assembly /MIRA/ candidate configurations --- for transport and fighter aircraft A79-36082

Spin flight research summary [SAE PAPER 790565] A79-36706

Selection of aircraft turbocharger systems [SAE PAPER 790608] A79-36739

An aircraft simulation using a product of exponentials as matrixant A79-38885

AIRCRAFT DESIGN

Industry seeks lighter aircraft weight --- aircraft design performance A79-36100

Boeing 757/767 - On-the-spot report A79-36374

Producing light aircraft - Three viability case studies A79-36376

Differential method of designing rational aircraft frames made of composite materials A79-36592

Formulation of empirical formulas for calculating the hydraulic resistance of networks --- aircraft deicing and air-conditioning systems A79-36593

The British Aerospace Harrier: Case study in aircraft design --- Book A79-36644

The Rockwell International Sabreliner-65: Case study in aircraft design --- Book A79-36645

The Lockheed C-5: Case study in aircraft design --- Book A79-36646

Adhesive bonded structure of new pressurized piston twin aircraft [SAE PAPER 790563] A79-36704

Design description of a four-place business jet using two WR-19 engines [SAE PAPER 790580] A79-36715

Improving business jet performance - The Mark Five Sabreliner [SAE PAPER 790582] A79-36717

A new light twin using bonded metal construction [SAE PAPER 790603] A79-36735

General aviation aircraft design for performance using small computers [SAE PAPER 790614] A79-36743

Development of the Beechcraft Model 77 [SAE PAPER 790617] A79-36745

Designing with damping materials to reduce noise and structural fatigue --- of aircraft components [SAE PAPER 790631] A79-36758

The Fairchild can-opener - Shturmovik of the eighties A79-36773

Airbus picks up speed - and the junior A310 takes off A79-36774

In Soviet service. V - Backfire A79-36775

Dassault-Breguet - The Mirage 2000 A79-36974

Changing requirements in aircraft design A79-37044

Impact of advanced technologies on aircraft design A79-37045

Computer graphics create the new wave of design A79-37046

Some main points about general-aviation design practice A79-37047

Design, meet production --- aircraft cost and performance tradeoff considerations A79-37048

A case study in design - The Gossamer Condor A79-37050

The 'cloud-in-cell' technique applied to the roll up of vortex sheets A79-37725

Westland unveils WG30 transport helicopter A79-38092

Aircraft design and strength /2nd revised and enlarged edition/ --- Russian book A79-38140

Factors influencing nacelle design on the 747 [AIAA PAPER 79-1236] A79-38996

Project Sunrise --- solar-powered aircraft flight demonstration [AIAA PAPER 79-1264] A79-39010

Characteristics of the advanced supersonic technology AST-105-1 configured for transpacific range with Pratt and Whitney aircraft variable stream control engines [NASA-TM-78818] N79-23888

Aircraft sonic boom: Studies on aircraft flight, aircraft design, and measurement. A bibliography with abstracts [NTIS/PS-79/0264/6] N79-24780

Helicopter rotor airfoil [NASA-CASE-LAR-12396-1] N79-24958

A variational theorem for laminated composite plates of nonlinear materials and applications to postbuckling N79-24977

AIRCRAFT DETECTION

Detection of low flying aircraft by acoustical means [REPT-8-78] N79-24779

A computer program for double sweep optimal smoothing [AD-A066512] N79-25278

AIRCRAFT ENGINES

Industry seeks lighter aircraft weight --- aircraft design performance A79-36100

Manufacturers developing fuel-efficient engines A79-36380

- Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas --- for aircraft auxiliary power systems
A79-36583
- Effectiveness of readmission of the gas in high-pressure-ratio small-scale turbines --- for aircraft auxiliary power systems
A79-36584
- Preliminary QCGAT program test results --- Quiet, Clean General Aviation Turbofan [SAE PAPER 790596]
A79-36729
- Concepts for reducing exhaust emissions and fuel consumption of the aircraft piston engine [SAE PAPER 790605]
A79-36737
- Dual breakerless aircraft magneto [SAE PAPER 790606]
A79-36738
- Selection of aircraft turbocharger systems [SAE PAPER 790608]
A79-36739
- Determination of cooling air mass flow for a horizontally-opposed aircraft engine installation [SAE PAPER 790609]
A79-36740
- New technologies for general aviation aircraft [SAE PAPER 790613]
A79-36742
- Rolls-Royce RB.401-07 turboprop engine for business aircraft in the 1980's [SAE PAPER 790620]
A79-36748
- A review of Curtiss-Wright rotary engine developments with respect to general aviation potential [SAE PAPER 790621]
A79-36749
- Engine induced structural-borne noise in a general aviation aircraft [SAE PAPER 790626]
A79-36754
- Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise [SAE PAPER 790573]
A79-36759
- Effects of air injection on a turbocharged Teledyne Continental Motors TSIO-360-C engine [SAE PAPER 790607]
A79-36760
- The evaluation of the weight of engine installations on transport aircraft
A79-37827
- A method of reducing aircraft turbine blade vibrations
A79-38819
- The multiple application core engine - Sizing and usage criteria --- high-pressure rotors in jet engines [AIAA PAPER 79-1123]
A79-38953
- The selection of materials technologies for full-scale development --- aircraft engine applications [AIAA PAPER 79-1152]
A79-38962
- Cost benefits from improved hot section life prediction technology --- for aircraft engine combustor and turbine parts [AIAA PAPER 79-1154]
A79-38963
- General aviation turbine engine /GATE/ concepts [AIAA PAPER 79-1157]
A79-38964
- Aircraft engine design using experimental stress analysis techniques [AIAA PAPER 79-1193]
A79-38978
- A European view on gas turbine engine monitoring of present and future civil aircraft [AIAA PAPER 79-1200]
A79-38982
- Fault-tolerant, high reliability electronic engine control system [AIAA PAPER 79-1202]
A79-38983
- Application of digital controls on the quiet clean short haul experimental engines [AIAA PAPER 79-1203]
A79-38984
- Electric propulsion for high performance light aircraft [AIAA PAPER 79-1265]
A79-39011
- Contribution to the development of motor emission regulations [ONERA, TP NO. 1979-43]
A79-39092
- Payback period - An engineering cost/benefit method --- for aircraft engines [AIAA PAPER 79-1235]
A79-39817
- Aircraft engine nozzle [NASA-CASE-ARC-10977-1]
N79-23971
- Water absorption of fluids/oils --- contamination of aircraft engine oils and inhibitors [AD-A065915]
N79-24158
- Aircraft engine oil analysis by neutron activation techniques [AD-A066202]
N79-24169
- Analysis of the impact of a 270 VDC power source on the avionics power supplies in the S-3A aircraft [AD-A066526]
N79-24989
- Premixed Prevaporized Combustor Technology Forum [NASA-CP-2078]
N79-24994
- Lean, premixed, prevaporized combustor conceptual design study
N79-25013
- Lean, premixed, prevaporized combustor conceptual design study
N79-25014
- Non-destructive inspection methods for propulsion systems and components [AGARD-LS-103]
N79-25412
- State-of-the-art of nondestructive inspection of aircraft engines
N79-25413
- High resolution radiography in the aero-engine industry
N79-25414
- AIRCRAFT EQUIPMENT**
- A system for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation [NASA-CASE-FRC-11005-1]
N79-24988
- AAES/TA-7C control and display interface [AD-A067219]
N79-24992
- Dynamic evaluation of experimental integral fuel-tank sealants, part 2 [AD-A066592]
N79-25236
- AIRCRAFT FUEL SYSTEMS**
- Formation of water-fuel emulsions in tanks of grounded aircraft
A79-36587
- Crash-resistant fuel systems for general aviation aircraft [SAE PAPER 790592]
A79-36726
- Fuel on fire - Rapid response to a military problem
A79-38090
- AIRCRAFT FUELS**
- Industry seeks lighter aircraft weight --- aircraft design performance
A79-36100
- Detonation characteristics of Soviet GOST 1012-72 aviation gasoline [SAE PAPER 790630]
A79-36757
- Lean, premixed, prevaporized combustion for aircraft gas turbine engines [NASA-TM-79148]
N79-23964
- Design and evaluation of aircraft heat source systems for use with high-freezing point fuels [NASA-CR-159568]
N79-24172
- Autoignition of fuels
N79-25001
- The impact of alternate fuels on aircraft configuration characteristics --- military aircraft [AD-A066983]
N79-25244
- AIRCRAFT GUIDANCE**
- Evaluation of an FM/CW range measurement system for VTOL landing
A79-36086
- Capturing and tracking performance of the horizontal guidance and control systems of the terminal configured vehicle [NASA-TM-80068]
N79-25034
- AIRCRAFT HAZARDS**
- The McDonnell Aircraft Company Lightning Simulation Laboratory
A79-37294
- Identification of voltage transients on aircraft cabling under LTA excitation --- Lightning Transient Analysis
A79-38531
- Method of assessment of the antistatic protection of aircraft [ONERA, TP NO. 1979-41]
A79-39090
- Aircraft icing [NASA-CP-2086]
N79-23912
- Aircraft icing: Introduction
N79-23913
- Executive summary of Aircraft Icing Specialists Workshop
N79-23914
- Icing of aircraft Some remarks with an historical slant from a cloud physicist
N79-23915

SUBJECT INDEX

A-6

- Fuel on fire - Rapid response to a military problem
A79-38090
- Survivability in aircraft fires - New standards
are needed
A79-38091
- RTCA standards - Improved specs. and regulations
--- in avionics equipment
A79-39919
- AIRCRAFT SPECIFICATIONS**
- The Lockheed C-5: Case study in aircraft design
--- Book
A79-36646
- Westland unveils WG30 transport helicopter
A79-38092
- AIRCRAFT STABILITY**
- A wind shear/ downdraft drift angle warning system
A79-38477
- AIRCRAFT STRUCTURES**
- Adhesive bonded structure of new pressurized
piston twin aircraft
[SAE PAPER 790563]
A79-36704
- Composite applications at Bell Helicopter
[SAE PAPER 790578]
A79-36713
- Nonlinear structural crash dynamics analyses
[SAE PAPER 790588]
A79-36722
- Aircon electrically heated acrylic --- for ice
formation prevention on aircraft transparencies
[SAE PAPER 790600]
A79-36732
- A new light twin using bonded metal construction
[SAE PAPER 790603]
A79-36735
- Pretting fatigue, with reference to aircraft
structures
[SAE PAPER 790612]
A79-36741
- Development of the Beechcraft Model 77
[SAE PAPER 790617]
A79-36745
- Aircraft design and strength /2nd revised and
enlarged edition/ --- Russian book
A79-38140
- Substructuring methods for design sensitivity
analysis and structural optimization
[AD-A065935]
N79-23949
- NOVA-2S, a stiffened panel extension of the NOVA-2
computer program
[AD-A066038]
N79-23951
- Prediction of the angular response power spectral
density of aircraft structures
[AD-A066141]
N79-23956
- Research and development activities in Italy in
the field of aerospace structures and materials
[AGARD-R-675]
N79-24202
- Advanced rotorcraft technology: Task force report
[NASA-TN-80541]
N79-24951
- Composite forward fuselage systems integration,
volume 2 --- effects of lightning
[AD-A066560]
N79-24984
- Non-destructive inspection methods for propulsion
systems and components
[AGARD-LS-103]
N79-25412
- Non-destructive methods for the early detection of
fatigue damage in aircraft components
N79-25417
- Broad-band transducers for nondestructive
inspection of aeronautical components
N79-25419
- AIRCRAFT SURVIVABILITY**
- Infrared signature measurement techniques and
simulation methods for aircraft survivability
[AIAA PAPER 79-1186]
A79-38975
- Method of assessment of the antistatic protection
of aircraft
[ONERA, TP NO. 1979-41]
A79-39090
- AIRCRAFT TIRES**
- Proper aircraft tire size selection - Optimum
performance with minimum maintenance
[SAE PAPER 790598]
A79-36730
- A tire runway interface friction prediction model
concept
A79-38137
- Feasibility and cost effectiveness of airborne
tire pressure indicating systems
[AD-A065513]
N79-24981
- AIRCRAFT WAKES**
- Turbulent wake measurements with a laser velocimeter
[AIAA PAPER 79-1087]
A79-38058
- Vortex-induced oscillations - A selective review
A79-39751
- Aircraft wake vortices. A bibliography with
abstracts
[NTIS/PS-79/0166/3]
N79-23939
- AIRFOIL PROFILES**
- The impact of noise regulations on propeller design
[SAE PAPER 790593]
A79-36727
- Low-speed single-element airfoil synthesis
N79-23890
- A comparison of the aerodynamic characteristics of
eight sailing airfoil sections
N79-23897
- A finite element method for the computation of the
transonic potential flow past airfoils
[MBB-UPE-1352-0]
N79-23935
- Airfoil optimization for transonic flow using the
methods of finite elements and characteristics
[MBB-UPE-1362-0]
N79-23937
- Low-speed wind tunnel results for a modified
13-percent-thick airfoil
[NASA-TN-X-74018]
N79-24960
- AIRFOILS**
- Analysis of an unsteady aerodynamic force on a
blade due to nonuniform amplitude gusts
A79-39059
- Low-speed single-element airfoil synthesis
N79-23890
- An exploratory investigation of the effect of
plastic coating on the profile drag of a
practical-metal-construction sailplane airfoil
N79-23891
- Some new airfoils
N79-23896
- An annular wing
[NASA-CASE-PRC-11007-2]
N79-24959
- Low-speed wind tunnel results for a modified
13-percent-thick airfoil
[NASA-TN-X-74018]
N79-24960
- Theoretical analysis of transonic flow past
unstaggered oscillating cascades
[AD-A063083]
N79-24963
- AIRFRAMES**
- Differential method of designing rational aircraft
frames made of composite materials
A79-36592
- Bonding and durability --- for airframe structures
[SAE PAPER 790561]
A79-36702
- Evaluation of methods for prediction of propulsion
system drag
[AIAA PAPER 79-1148]
A79-38961
- Interactional aerodynamics of the single rotor
helicopter configuration. Volume 2B: Harmonic
analyses of airframe surface pressure data, runs
7 - 14, midsection
[AD-A061860]
N79-23934
- The production function and airframe cost estimation
[AD-A065570]
N79-23952
- ANALYZE: Analysis of aerospace structures with
membrane elements
[AD-A065633]
N79-24379
- Interactional aerodynamics of the single rotor
helicopter configuration. Volume 2B: Harmonic
analysis of airframe surface pressure data, runs
7-14, mid section
[AD-A061860]
N79-24967
- A cooling system for an aircraft having a cruise
range from Mach 2 to Mach 8
[NASA-CASE-LAR-12406-1]
N79-24980
- The influence of fleet variability on crack growth
tracking procedures for transport/bomber aircraft
[AD-A066596]
N79-25433
- AIRLINE OPERATIONS**
- The airport performance model. Volume 1:
Extensions, validations, and applications
[AD-A062863]
N79-25040
- AIRPLANE PRODUCTION COSTS**
- Design, meet production --- aircraft cost and
performance tradeoff considerations
A79-37048
- AIRPORTS**
- The airport performance model. Volume 1:
Extensions, validations, and applications
[AD-A062863]
N79-25040
- AIRSHIPS**
- Propelled lighter-than-air vehicles
[GPO-43-457]
N79-23925
- AIRSPEED**
- Effects of forward velocity on sound radiation
from convecting monopole and dipole sources in
jet flow --- subsonic aircraft model
A79-38393

ALGORITHMS

SUBJECT INDEX

- Wing shape optimization for maximum cross-country speed, with mathematical programming N79-23899
- ALGORITHMS**
The role of three-dimensional flow analysis in the design of turbomachinery [AIAA PAPER 79-1231] A79-38995
- ALIGNMENT**
Driveshaft alignment indicator [AD-A065988] N79-23973
- ALL-WEATHER AIR NAVIGATION**
Night/Adverse Weather A-10 evaluator program A79-38479
- ALTITUDE**
A system for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation [NASA-CASE-PRC-11005-1] N79-24988
- ALTITUDE TESTS**
Multivariable control altitude demonstration on the F100 turbofan engine [AIAA PAPER 79-1204] A79-39814
- ALUMINUM ALLOYS**
Definition and non-destructive detection of critical adhesive bond-line flaws [AD-A065584] N79-24163
- ALUMINUM COATINGS**
Internally coated air-cooled gas turbine blading [NASA-CR-159574] N79-25018
- AMPLIFIERS**
Model study of transient processes in a hydraulic power amplifier A79-38814
- ANGLE OF ATTACK**
Control considerations for CCV fighters at high angles of attack A79-37295
Interference effects of aircraft components on the local blade angle of attack of a wing-mounted propeller [NASA-TM-78587] N79-25021
- ANTENNA RADIATION PATTERNS**
High frequency near field scattering by an elliptic disk [AD-A065586] N79-24214
Fuselage-mounted antenna code: User's manual [AD-A065587] N79-24215
Wing-mounted antenna code: User's manual [AD-A065589] N79-24216
An iterative approach for computing an antenna aperture distribution from given radiation pattern data [AD-A065590] N79-24217
- APPLICATIONS PROGRAMS (COMPUTERS)**
The application of microprocessor technology to in-flight computation N79-23902
- APPROXIMATION**
Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927
Construction of an initial approximation for the solution of the integral equation of a lifting surface A79-35928
- ASYMPTOTIC SERIES**
An asymptotic result for the scattering of a plane wave by a smooth convex cylinder [AD-A065588] N79-24229
- ATMOSPHERIC ATTENUATION**
Thermospheric propagation of sonic booms from the Concorde supersonic transport [AD-A067201] N79-25855
- ATMOSPHERIC RADIATION**
Observation of atmospheric interactions at aeroplane altitude --- gamma ray emulsion experiments A79-37573
- ATMOSPHERIC TURBULENCE**
Experimental data on the dynamic properties of several propeller vanes --- turbulence measurement in wind tunnel A79-38943
- AUTOMATIC CONTROL**
Advanced braking controls for business aircraft [SAE PAPER 790599] A79-36731
- AUTOMATIC FLIGHT CONTROL**
Drone formation control system /DFCS/ - A new generation test range system A79-36084
Westland unveils WG30 transport helicopter A79-38092
Digital flight control research using microprocessor technology A79-38533
Evaluation of a digital helicopter control system --- BO-105 helicopter [MBB-UFE-1349-0] N79-23980
- AUTOMATIC PILOTS**
Capturing and tracking performance of the horizontal guidance and control systems of the terminal configured vehicle [NASA-TM-80068] N79-25034
- AUXILIARY POWER SOURCES**
Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas --- for aircraft auxiliary power systems A79-36583
Effectiveness of readmission of the gas in high-pressure-ratio small-scale turbines --- for aircraft auxiliary power systems A79-36584
- AVIONICS**
The results of synthesizing and evaluating potential solutions for Multi-Function Inertial Reference Assembly /MIRA/ candidate configurations --- for transport and fighter aircraft A79-36082
Boeing 757/767 - On-the-spot report A79-36374
An optical-fiber multiterminal data system for aircraft A79-36484
A Demonstration Advanced Avionics System for general aviation [SAE PAPER 790569] A79-36709
Electronic system safety - Testing reality --- for avionics [SAE PAPER 790570] A79-36710
The Digibus multiplex at the heart of avionics A79-36975
F-18 - A special report A79-38131
Night/Adverse Weather A-10 evaluator program A79-38479
Exploring team avionics systems by simulation A79-38882
The F-16 RIW program --- Reliability Improvement Warranty A79-39889
CERT technology applied to an airborne radar --- Combined Environment Reliability Testing A79-39893
Lower avionic temperature - Lower life cycle cost A79-39914
RTCA standards - Improved specs. and regulations --- in avionics equipment A79-39919
The effect of endless burn-in on reliability growth projections --- for solid state aviation electronics equipment A79-39920
Avionics standardization potential analysis [AD-A066138] N79-23958

- Propeller aircraft noise around general aviation airports [SAE PAPER 790594] A79-36728
- DATA SMOOTHING**
- A computer program for double sweep optimal smoothing [AD-A066512] N79-25278
- DATA SYSTEMS**
- An optical-fiber multiterminal data system for aircraft A79-36484
- Avionics technology for tactical data handling N79-25979
- DATA TRANSMISSION**
- An optical-fiber multiterminal data system for aircraft A79-36484
- DEAD RECKONING**
- Stability analysis of relative navigation systems --- TDMA system for multi-member aircraft communities A79-36090
- DEFECTS**
- Definition and non-destructive detection of critical adhesive bond-line flaws [AD-A065584] N79-24163
- DEFENSE PROGRAM**
- Development of an airborne military system (MRCA system) [NBB-UPE-1322-0] N79-23904
- DEFLECTORS**
- Static test of a large scale swivel nozzle thrust deflector [AIAA PAPER 79-1285] A79-39020
- DEICERS**
- Formulation of empirical formulas for calculating the hydraulic resistance of networks --- aircraft deicing and air-conditioning systems A79-36593
- Aircon electrically heated acrylic --- for ice formation prevention on aircraft transparencies [SAE PAPER 790600] A79-36732
- DESIGN ANALYSIS**
- Design of quiet efficient propellers [SAE PAPER 790584] A79-36719
- Lean, premixed, prevaporized combustor conceptual design study N79-25013
- Lean, premixed, prevaporized combustor conceptual design study N79-25014
- DIAGNOSIS**
- Diagnostics of wear in aeronautical systems [NASA-TM-79185] N79-24350
- DIFFRACTION**
- High frequency near field scattering by an elliptic disk [AD-A065586] N79-24214
- DIFFUSION**
- Model diffuser investigation for propulsion wind tunnel 16T [AD-A065822] N79-23984
- DIGITAL COMMAND SYSTEMS**
- Informativeness and effectiveness of digital command-generating devices --- flight vehicle onboard computers A79-36588
- Evaluation of a digital helicopter control system --- BO-105 helicopter [NBB-UPE-1349-0] N79-23980
- DIGITAL COMPUTERS**
- A general aviation flight test application of the on-board computer [SAE PAPER 790583] A79-36718
- Multifunction keyboard implementation study [AD-A066140] N79-25046
- DIGITAL NAVIGATION**
- Hyperbolic positioning per se is passe --- navigation computations from range measurements using microprocessor A79-36070
- Recent results in navigation systems utilizing signal aiding from Navstar satellites A79-36096
- Capturing and tracking performance of the horizontal guidance and control systems of the terminal configured vehicle [NASA-TM-80068] N79-25034
- DIGITAL SYSTEMS**
- Application of digital controls on the quiet clean short haul experimental engines [AIAA PAPER 79-1203] A79-38984
- RELSIM-A systems reliability simulation code A79-39900
- VOLAR: A digital computer program for simulating VSTOL aircraft launch and recovery from small ships. Volume 1: Program description [AD-A066172] N79-23954
- Analysis of digital flight control systems with flying qualities applications. Volume 1: Executive summary [AD-A066809] N79-25035
- Analysis of digital flight control systems with flying qualities applications. Volume 2: Technical report [AD-A067177] N79-25036
- DIRECT POWER GENERATORS**
- Analytical modeling of the dynamics of brushless dc motors for aerospace applications: A conceptual framework [NASA-TM-80445] N79-25310
- DIRECTIONAL SOLIDIFICATION (CRYSTALS)**
- Directionally solidified blades - Greater strength A79-36248
- DISPLAY DEVICES**
- A system for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation [NASA-CASE-FRC-11005-1] N79-24988
- Color display design guide [AD-A066630] N79-24991
- AAES/TA-7C control and display interface [AD-A067219] N79-24992
- Processing of airborne reconnaissance data for in-flight display and near real-time transmission [AGARD-AR-135] N79-24993
- Design of an off-axis wide field-of-view visual display system for flight simulators [AD-A066530] N79-25044
- Multifunction keyboard implementation study [AD-A066140] N79-25046
- DISTORTION**
- Combined pressure and temperature distortion effects on internal flow of a turbofan engine [NASA-TM-79136] N79-23963
- Effect of steady-state pressure distortion on flow characteristics entering a turbofan engine [NASA-TM-79134] N79-23969
- Blast induced distortion experiments on an engine inlet [AD-A066811] N79-25026
- DRAW**
- Numerical optimization techniques for bound circulation distribution for minimum induced drag of nonplanar wings: Basic formulations [NASA-CR-3154] N79-23924
- DRAG MEASUREMENT**
- Recent results obtained with a new method for measuring aircraft power and drag in flight [SAE PAPER 790616] A79-36744
- Measurement of the drag of slender cones in hypersonic flow at low Reynolds numbers using a magnetic suspension and balance [OUEL-1235/78] N79-23938
- DRONE AIRCRAFT**
- Drone formation control system /DFCS/ - A new generation test range system A79-36084
- DROP TESTS**
- Nonlinear structural crash dynamics analyses [SAE PAPER 790588] A79-36722
- DRY FRICTION**
- Dry friction in the aerospace industry A79-39873

DUCTED FANS

- Numerical calculation of inviscid transonic flow through rotors and fans N79-23906
- Theoretical fan velocity distortions due to inlets and nozzles --- in V/STOL aircraft [NASA-TM-79150] N79-23911
- DURABILITY**
 - Bonding and durability --- for airframe structures [SAE PAPER 790561] A79-36702
- DYNAMIC CHARACTERISTICS**
 - Experimental data on the dynamic properties of several propeller vanes --- turbulence measurement in wind tunnel A79-38943
- DYNAMIC MODELS**
 - Model verification of force determination for measuring vibratory loads --- of rotors on helicopters A79-36379
 - The dynamics of a general aviation pilot promotion campaign A79-38886
- DYNAMIC RESPONSE**
 - The analysis of propellers including interaction effects --- for general aviation aircraft [SAE PAPER 790576] A79-36712
 - Nonlinear structural crash dynamics analyses [SAE PAPER 790588] A79-36722
- DYNAMIC STABILITY**
 - Technical evaluation report on the Fluid Dynamics Panel Symposium on Dynamic Stability parameters [AGARD-AR-137] N79-23981
- DYNAMIC STRUCTURAL ANALYSIS**
 - Nonlinear structural crash dynamics analyses [SAE PAPER 790588] A79-36722
 - Aircraft sonic boom: Effects on buildings. A bibliography with abstracts [NTIS/PS-79/0265/3] N79-24201
- DYNAMIC TESTS**
 - Application of advanced data reduction methods to gas turbine dynamic analysis A79-36024
 - Dynamic evaluation of experimental integral fuel-tank sealants, part 2 [AD-A066592] N79-25236

E

ECONOMIC ANALYSIS

- Payback period - An engineering cost/benefit method --- for aircraft engines [AIAA PAPER 79-1235] A79-39817

ECONOMIC FACTORS

- New opportunities for future small civil turbine engines - Overviewing the GATE studies [SAE PAPER 790619] A79-36747

EDDY VISCOSITY

- A method for the calculation of 3D boundary layers on practical wing configurations A79-38906

EJECTORS

- Evaluation of an ejector-powered engine simulator at transonic Mach numbers [AIAA PAPER 79-1165] A79-38967

ELASTOMERS

- Dynamic evaluation of experimental integral fuel-tank sealants, part 2 [AD-A066592] N79-25236

ELECTRIC IGNITION

- Dual breakerless aircraft magneto [SAE PAPER 790606] A79-36738

ELECTRIC MOTORS

- Electromechanical actuation for business aircraft [SAE PAPER 790622] A79-36750

ELECTRIC POTENTIAL

- Identification of voltage transients on aircraft cabling under LTA excitation --- Lightning Transient Analysis A79-38531

ELECTRIC PROPULSION

- Electric propulsion for high performance light aircraft [AIAA PAPER 79-1265] A79-39011

ELECTROMAGNETIC COMPATIBILITY

- Composite forward fuselage systems integration, volume 2 --- effects of lightning [AD-A066560] N79-24984

ELECTROMAGNETIC PULSES

- The estimation of induced-voltage peak magnitude and energy level under LTA/EMP excitation of low-loss aircraft cabling --- Lightning Transit Analysis/Electro-Magnetic Pulse A79-37238

ELECTROMAGNETIC SCATTERING

- High frequency near field scattering by an elliptic disk [AD-A065586] N79-24214
- An asymptotic result for the scattering of a plane wave by a smooth convex cylinder [AD-A065588] N79-24229

ELECTROMECHANICAL DEVICES

- Electromechanical actuation for business aircraft [SAE PAPER 790622] A79-36750
- A comparison of hydraulic, pneumatic, and electro-mechanical actuators for general aviation flight controls [SAE PAPER 790623] A79-36751
- The operational impact of Navy's first TAAF program --- P-3C Test, Analyze and Fix A79-39890

- Analytical modeling of the dynamics of brushless dc motors for aerospace applications: A conceptual framework [NASA-TM-80445] N79-25310

ELECTRON BEAM WELDING

- Application of electron-beam welding to aviation production --- tests of turbine engine parts welded by electron beam N79-24940

ELECTRONIC CONTROL

- Fault-tolerant, high reliability electronic engine control system [AIAA PAPER 79-1202] A79-38983
- An electric control for an electrohydraulic active control aircraft landing gear [NASA-CR-3113] N79-23948

ELECTRONIC COUNTERMEASURES

- The intercept of covert radar A79-38132

ELECTRONIC EQUIPMENT

- F-18 - A special report A79-38131

ELECTRONIC EQUIPMENT TESTS

- Electronic system safety - Testing reality --- for avionics [SAE PAPER 790570] A79-36710

ELECTRONIC FILTERS

- A navigation filter for an integrated GPS/JTIDS/INS system for a tactical aircraft --- Joint Tactical Information Distribution System A79-36087

ELECTROSTATIC CHARGE

- Method of assessment of the antistatic protection of aircraft [ONERA, TP NO. 1979-41] A79-39090

ELECTROSTATICS

- Factors affecting electrostatic hazards [AD-A066927] N79-25245

EMULSIONS

- Formation of water-fuel emulsions in tanks of grounded aircraft A79-36587

ENGINE CONTROL

- Selection of aircraft turbocharger systems [SAE PAPER 790608] A79-36739
- Fault-tolerant, high reliability electronic engine control system [AIAA PAPER 79-1202] A79-38983
- Application of digital controls on the quiet clean short haul experimental engines [AIAA PAPER 79-1203] A79-38984
- A streamlined control system development process --- to optimize aircraft propulsion system performance [AIAA PAPER 79-1344] A79-39048

ENGINE DESIGN

- Industry seeks lighter aircraft weight --- aircraft design performance A79-36100
- Manufacturers developing fuel-efficient engines A79-36380
- Allowing for the wall boundary layer in an axial compressor stage A79-36586

SUBJECT INDEX

ENVIRONMENTAL TESTS

Preliminary QCGAT program test results --- Quiet, Clean General Aviation Turbofan [SAE PAPER 790596]	A79-36729	ENGINE INLETS	Aerodynamic problems in engine airframe integration on fighter airplanes [HBB-UPE-1359-0]	N79-23936
New technologies for general aviation aircraft [SAE PAPER 790613]	A79-36742		Self stabilizing sonic inlet [NASA-CASE-LEW-11890-1]	N79-24976
Rolls-Royce RB.401-07 turbofan engine for business aircraft in the 1980's [SAE PAPER 790620]	A79-36748		Blast induced distortion experiments on an engine inlet [AD-A066811]	N79-25026
Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise [SAE PAPER 790573]	A79-36759	ENGINE MONITORING INSTRUMENTS	A European view on gas turbine engine monitoring of present and future civil aircraft [AIAA PAPER 79-1200]	A79-38982
The evaluation of the weight of engine installations on transport aircraft	A79-37827		Diagnostics of wear in aeronautical systems	A79-39805
Damage-tolerant fan blade design [AIAA PAPER 79-1119]	A79-38951	ENGINE NOISE	Propeller aircraft noise around general aviation airports [SAE PAPER 790594]	A79-36728
Propulsion system sensitivities for a strategic aircraft [AIAA PAPER 79-1121]	A79-38952	ENGINE PARTS	Cost benefits from improved hot section life prediction technology --- for aircraft engine combustor and turbine parts [AIAA PAPER 79-1154]	A79-38963
The multiple application core engine - Sizing and usage criteria --- high-pressure rotors in jet engines [AIAA PAPER 79-1123]	A79-38953		Small hole drilling and inspection with pulsed laser systems --- in air-cooled aircraft engine structures [AIAA PAPER 79-1268]	A79-39012
The selection of materials technologies for full-scale development --- aircraft engine applications [AIAA PAPER 79-1152]	A79-38962	ENGINE STARTERS	A starter for gas turbine engines	A79-36797
General aviation turbine engine /GATE/ concepts [AIAA PAPER 79-1157]	A79-38964	ENGINE TESTS	Application of advanced data reduction methods to gas turbine dynamic analysis	A79-36024
A novel correlation of centrifugal compressor performance for off-design prediction [AIAA PAPER 79-1159]	A79-38965		A review of Curtiss-Wright rotary engine developments with respect to general aviation potential [SAE PAPER 790621]	A79-36749
Turbo-fan design for general aviation - The evolution of the RB.401 [AIAA PAPER 79-1160]	A79-38966		Engine induced structural-borne noise in a general aviation aircraft [SAE PAPER 790626]	A79-36754
Aircraft engine design using experimental stress analysis techniques [AIAA PAPER 79-1193]	A79-38978		Detonation characteristics of Soviet GOST 1012-72 aviation gasoline [SAE PAPER 790630]	A79-36757
What small turbine engine does the small helicopter need, or The road to hell is paved with good intentions --- fuel consumption, performance, environmental and engine reliability and acceptability considerations subordinating advanced turbine engine development for small helicopters [AIAA PAPER 79-1314]	A79-39032		High level maintenance below sea level	A79-38825
Lean, premixed, prevaporized combustion for aircraft gas turbine engines [AIAA PAPER 79-1318]	A79-39034		Test verification of a turbofan partial swirl afterburner [AIAA PAPER 79-1199]	A79-38981
The application of the Prop-Fan concept in preliminary design of a very advanced technology light twin /VATLIT '85/ [AIAA PAPER 79-1343]	A79-39047		A streamlined control system development process --- to optimize aircraft propulsion system performance [AIAA PAPER 79-1344]	A79-39048
A streamlined control system development process --- to optimize aircraft propulsion system performance [AIAA PAPER 79-1344]	A79-39048		Multivariable control altitude demonstration on the F100 turbofan engine [AIAA PAPER 79-1204]	A79-39814
Contribution to the development of motor emission regulations [ONERA, TP NO. 1979-43]	A79-39092		Turbulence characteristics of compressor discharge flows --- JT9D engine tests	N79-24995
Materials and structural aspects of advanced gas-turbine helicopter engines	A79-39804		Turbulence measurements in the compressor exit flow of a General Electric CP6-50 engine	N79-24996
Payback period - An engineering cost/benefit method --- for aircraft engines [AIAA PAPER 79-1235]	A79-39817	ENGINEERING MANAGEMENT	The test pilot in the airline industry or 'My bags are packed and I'm ready to go'	A79-38478
Advanced low emissions catalytic combustor program at General Electric	N79-25011	ENGINES	Advanced General Aviation Turbine Engine (GATE) concepts [NASA-CR-159603]	N79-25017
Advanced low emissions catalytic combustor program at Pratt and Whitney	N79-25012	ENVIRONMENT SIMULATION	The McDonnell Aircraft Company Lightning Simulation Laboratory	A79-37294
Lean, premixed, prevaporized combustor conceptual design study	N79-25013	ENVIRONMENTAL CONTROL	Lower avionics temperature - Lower life cycle cost	A79-39914
Lean, premixed, prevaporized combustor conceptual design study	N79-25014	ENVIRONMENTAL SURVEYS	Photovoltaics and environmental impact considerations	N79-25496
Design study and performance analysis of a high-speed multistage variable-geometry fan for a variable cycle engine [NASA-CR-159545]	N79-25020	ENVIRONMENTAL TESTS	CERT technology applied to an airborne radar --- Combined Environment Reliability Testing	A79-39893
ENGINE FAILURE				
Effects of steady-state pressure distortion on the stall margin of a J85-21 turbojet engine [NASA-TM-79123]	N79-23968			

EQUATIONS OF MOTION

SUBJECT INDEX

EQUATIONS OF MOTION

An introduction to dynamic derivatives. 2: The equations of motion for wind tunnel pitch-yaw oscillation rigs
[ARL-AERO-NOTE-377] N79-23982

EQUIPMENT SPECIFICATIONS

RTCA standards - Improved specs. and regulations --- in avionics equipment
A79-39919

EUROPE

Joint Airworthiness Requirements - Their history and progress
A79-37149

EUROPEAN AIRBUS

Airbus picks up speed - and the junior A310 takes off
A79-36774

A European view on gas turbine engine monitoring of present and future civil aircraft
[AIAA PAPER 79-1200] A79-38982

EXHAUST FLOW SIMULATION

V/STOL aircraft configuration effects on exhaust gas ingestion
[AIAA PAPER 79-1284] A79-39019

EXHAUST GASES

Concepts for reducing exhaust emissions and fuel consumption of the aircraft piston engine
[SAE PAPER 790605] A79-36737

Contribution to the development of motor emission regulations
[ONERA, TP NO. 1979-43] A79-39092

Effect of degree of fuel vaporization upon emissions for a premixed prevaporized combustion system --- for gas turbine engines
[NASA-TM-79154] N79-23965

Two-stage supercharger sets: Efficiency and head distribution under full- and part-load conditions
[RTS-11613] N79-24342

Effect of fuel/air nonuniformity on nitric oxide emissions
N79-25004

Optical in situ versus probe measurements of nitric oxide concentration as a function of axial position in a combustor exhaust
[AD-A067329] N79-25025

Exhaust emissions characteristics for a general aviation light-aircraft Avco Lycoming 10-360-A1B6D piston engine
[AD-A066556] N79-25544

Exhaust emissions characteristics for a general aviation light-aircraft Avco-Lycoming 10-360-B1BD piston engine
[AD-A066589] N79-25545

Aircraft air pollution emission estimation techniques, ACEE
[AD-A067262] N79-25550

Air pollutant emission factors for military and civil aircraft
[PB-292520/4] N79-25567

EXHAUST NOZZLES

Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface
[AIAA PAPER 79-1170] A79-38969

EXPANDABLE STRUCTURES

Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface
[NASA-TM-79157] N79-23966

EXPONENTIAL FUNCTIONS

An aircraft simulation using a product of exponentials as matrizant
A79-38885

F

F-5 AIRCRAFT

Some observations on the mechanism of aircraft wing rock
A79-38135

F-15 AIRCRAFT

Precision controllability of the F-15 airplane
[NASA-TM-72861] N79-23979

F-16 AIRCRAFT

The F-16 RIW program --- Reliability Improvement Warranty
A79-39889

Energy maneuverability display validation --- F-16 aircraft
[AFPD-TR-78-35-VOL-1] N79-23947

F-18 AIRCRAFT

F-18 - A special report
A79-38131

F-111 AIRCRAFT

Identification of voltage transients on aircraft cabling under LTA excitation --- Lightning Transient Analysis
A79-38531

FAIL-SAFE SYSTEMS

Reliability, performance, and fault isolation considerations in the design of interconnected navigation systems
A79-36077

Fail-safe optimal design of structures with substructuring
[AD-A065936] N79-23950

FAILURE ANALYSIS

Bonding and durability --- for airframe structures
[SAE PAPER 790561] A79-36702

The aircraft air conditioner data revisited --- for comparison of alternative system concepts
A79-39895

Development of in-flight steady-state failure rates
A79-39912

The effect of endless burn-in on reliability growth projections --- for solid state aviation electronics equipment
A79-39920

FAIRCHILD-HILLER AIRCRAFT

The Fairchild can-opener - Shturmovik of the eighties
A79-36773

FATIGUE (MATERIALS)

Pretting fatigue, with reference to aircraft structures
[SAE PAPER 790612] A79-36741

Designing with damping materials to reduce noise and structural fatigue --- of aircraft components
[SAE PAPER 790631] A79-36758

Definition and non-destructive detection of critical adhesive bond-line flaws
[AD-A065584] N79-24163

Non-destructive methods for the early detection of fatigue damage in aircraft components
N79-25417

FATIGUE LIFE

The strainrange partitioning behavior of an advanced gas turbine disk alloy, AF2-1DA
[AIAA PAPER 79-1192] A79-38977

FATIGUE TESTING MACHINES

Installation for studying fatigue strength of materials in acoustic loading --- for aircraft skins
A79-39070

FEEDBACK CONTROL

Multivariable control altitude demonstration on the F100 turbofan engine
[NASA-TM-79183] N79-25015

FIBER OPTICS

An optical-fiber multiterminal data system for aircraft
A79-36484

FIGHTER AIRCRAFT

The results of synthesizing and evaluating potential solutions for Multi-Function Inertial Reference Assembly /MIRA/ candidate configurations --- for transport and fighter aircraft
A79-36082

The British Aerospace Harrier: Case study in aircraft design --- Book
A79-36644

Control considerations for CCV fighters at high angles of attack
A79-37295

Reliability and maintainability contribution to Hornet mission success
A79-39915

Development of an airborne military system (MRCA system)
[HBB-UFE-1322-0] N79-23904

Aerodynamic problems in engine airframe integration on fighter airplanes
[HBB-UFE-1359-0] N79-23936

FILM COOLING

- Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface
[AIAA PAPER 79-1170] A79-38969
- Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface
[NASA-TM-79157] N79-23966

FILTRATION

- A filterability study of corrosion inhibited JP-4
[AD-A066887] N79-25247

FINITE ELEMENT METHOD

- Nonlinear structural crash dynamics analyses
[SAE PAPER 790588] A79-36722
- A finite element method for the computation of the transonic potential flow past airfoils
[NBB-UPE-1352-0] N79-23935
- Airfoil optimization for transonic flow using the methods of finite elements and characteristics
[NBB-UPE-1362-0] N79-23937
- Dynamic structural analysis with substructures
[AD-A065937] N79-24378
- ANALYZE: Analysis of aerospace structures with membrane elements
[AD-A065633] N79-24379
- The computation of transonic flow in wind tunnels at inlets and cascades using the finite element method
[NBB-UPE-1421-0] N79-24970

FINS

- Evaluation of ground-launch firings for the improved 2.75-inch rocket
[AIAA PAPER 79-1297] A79-39027
- Low-speed wind-tunnel investigation of wing fins as trailing-vortex-alleviation devices on a transport airplane model
[NASA-TP-1453] N79-24961

FIRE EXTINGUISHERS

- Fuel on fire - Rapid response to a military problem
A79-38090

FIRE PREVENTION

- Crash-resistant fuel systems for general aviation aircraft
[SAE PAPER 790592] A79-36726
- Survivability in aircraft fires - New standards are needed
A79-38091

FLAME HOLDERS

- Lean stability augmentation for premixing, prevaporizing combustors
[AIAA PAPER 79-1319] A79-39035

FLAME PROPAGATION

- Survivability in aircraft fires - New standards are needed
A79-38091
- The effect of hydrogen addition on ignition delays and flame propagation in spark ignition engines
A79-38387

FLAPPING

- Rotor blade stability in turbulent flows. I
A79-38118

FLEXIBLE WINGS

- Handling qualities of large flexible control-configured aircraft
[NASA-CR-158694] N79-25033

FLIGHT CHARACTERISTICS

- The Learjet 'Longhorn' series - The first jets with winglets
[SAE PAPER 790581] A79-36716
- Application of parameter identification techniques to analysis of flight data
A79-37735

- Proceedings of AFPPDL Flying Qualities Symposium
[AD-A066493] N79-24982

- Analysis of digital flight control systems with flying qualities applications. Volume 1: Executive summary
[AD-A066809] N79-25035

- Analysis of digital flight control systems with flying qualities applications. Volume 2: Technical report
[AD-A067177] N79-25036

FLIGHT CONDITIONS

- An improved method for predicting the effects of flight on jet mixing noise
A79-39803

FLIGHT CONTROL

- The results of synthesizing and evaluating potential solutions for Multi-Function Inertial Reference Assembly /MIRA/ candidate configurations --- for transport and fighter aircraft
A79-36082

- Effects of a spin chute installation on spin characteristics --- of light general aviation aircraft
[SAE PAPER 790564] A79-36705

- Electromechanical actuation for business aircraft
[SAE PAPER 790622] A79-36750

- A comparison of hydraulic, pneumatic, and electro-mechanical actuators for general aviation flight controls
[SAE PAPER 790623] A79-36751

- Technical evaluation report on the 27th Guidance and Control Panel Symposium on the V/STOL Aircraft at Night and in Poor Visibility
[AGARD-AR-142] N79-23946

- Handling qualities of large flexible control-configured aircraft
[NASA-CR-158694] N79-25033

- Analysis of digital flight control systems with flying qualities applications. Volume 1: Executive summary
[AD-A066809] N79-25035

- Analysis of digital flight control systems with flying qualities applications. Volume 2: Technical report
[AD-A067177] N79-25036

- Technical evaluation report on the 25th Guidance and Control Panel Symposium on guidance and Control Design Considerations for Low Altitude and Terminal Area Flight
[AGARD-AR-129] N79-25037

FLIGHT HAZARDS

- Safety hazard of aircraft icing
N79-23916

FLIGHT INSTRUMENTS

- The application of microprocessor technology to in-flight computation
N79-23902

- Energy maneuverability display validation --- F-16 aircraft
[AFPPDL-TR-78-35-VOL-1] N79-23947

- Processing of airborne reconnaissance data for in-flight display and near real-time transmission
[AGARD-AR-135] N79-24993

FLIGHT SIMULATION

- Control considerations for CCV fighters at high angles of attack
A79-37295

- A wind shear/downdraft drift angle warning system
A79-38477

- An aircraft simulation using a product of exponentials as matrixant
A79-38885

- Effects of steady-state pressure distortion on the stall margin of a J85-21 turbojet engine
[NASA-TM-79123] N79-23968

- A simplified rotor system mathematical model for piloted flight dynamics simulation
[NASA-TM-78575] N79-23977

- Motion in flight simulation: An annotated bibliography
[AD-A061687] N79-25042

- Multifunction keyboard implementation study
[AD-A066140] N79-25046

FLIGHT SIMULATORS

- Sidestick/Throttle Controller - An alternate approach
A79-38476

- Active control for the Total-In-Flight simulator (ACTIFS)
[NASA-CR-3118] N79-23978

- An evaluation of turn anticipation techniques and offset flying procedures using a single-waypoint RNAV system
[AD-A066555] N79-24974

- AAES laboratory simulator requirements (A-7 aircraft)
[AD-A066393] N79-25041

- Optimal placement of regional flight simulators
[AD-A060450] N79-25043

- Design of an off-axis wide field-of-view visual display system for flight simulators
[AD-A066530] N79-25044

FLIGHT TEST INSTRUMENTS

SUBJECT INDEX

FLIGHT TEST INSTRUMENTS

A general aviation flight test application of the on-board computer
[SAE PAPER 790583] A79-36718

FLIGHT TESTS

Spin flight research summary
[SAE PAPER 790565] A79-36706
Canadair Challenger flight test status
[SAE PAPER 790602] A79-36734
A new light twin using bonded metal construction
[SAE PAPER 790603] A79-36735
A unique facility for V/STOL aircraft hover testing
A79-37296
The test pilot in the airline industry or 'My bags are packed and I'm ready to go'
A79-38478

Project Sunrise --- solar-powered aircraft flight demonstration
[AIAA PAPER 79-1264] A79-39010
Polar lift and drag determination during flight tests
[MBB-UPE-1410-0] N79-24986
Determination of subcritical frequency and damping from B-1 flight flutter test data
[NASA-CP-3152] N79-25426

FLIGHT VEHICLES

Informativeness and effectiveness of digital command-generating devices --- flight vehicle onboard computers
A79-36588

FLORIDA

Ground winds for Kennedy Space Center, Florida, 1979 revision
[NASA-TM-78229] N79-25662

FLOW CHARACTERISTICS

Determination of cooling air mass flow for a horizontally-opposed aircraft engine installation
[SAE PAPER 790609] A79-36740
Effect of steady-state pressure distortion on flow characteristics entering a turbofan engine
[NASA-TM-79134] N79-23969
Turbulence characteristics of compressor discharge flows --- JT9D engine tests
N79-24995
Turbulence measurements in the compressor exit flow of a General Electric CF6-50 engine
N79-24996

FLOW DISTORTION

Combined pressure and temperature distortion effects on internal flow of a turbofan engine
[AIAA PAPER 79-1309] A79-39031
Method of determining non-steady-state force characteristics and flywheel effect of turbine blades from the streamflow pattern
A79-39071
Effects of steady-state pressure distortion on the stall margin of a J85-21 turbojet engine
[NASA-TM-79123] N79-23968

FLOW DISTRIBUTION

Investigation of a laser Doppler velocimeter system to measure the flow field of a large scale V/STOL aircraft in ground effect
[AIAA PAPER 79-1184] A79-38974
The role of three-dimensional flow analysis in the design of turbomachinery
[AIAA PAPER 79-1231] A79-38995
Analysis of an unsteady aerodynamic force on a blade due to nonuniform amplitude gusts
A79-39059

FLOW GEOMETRY

Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas --- for aircraft auxiliary power systems
A79-36583
Influence of the flow angle on the characteristics of an elbow-shaped air intake --- of gas turbine engines
A79-36585
The 'cloud-in-cell' technique applied to the roll up of vortex sheets
A79-37725
Profiling of two-dimensional and three-dimensional nozzles and calculation of their flows
A79-38168

FLOW MEASUREMENT

Experimental analysis methods for unsteady flows in turbomachines
[ONERA, TP NO. 1979-59] A79-39095

FLOW RESISTANCE

Formulation of empirical formulas for calculating the hydraulic resistance of networks --- aircraft deicing and air-conditioning systems
A79-36593

FLOW THEORY

Lectures on hydroaeromechanics --- Russian book
A79-36347

FLOW VELOCITY

Velocity slip and temperature difference of gas mixtures in quasi-one-dimensional nozzle flows
A79-36423
Turbulent wake measurements with a laser velocimeter
[AIAA PAPER 79-1087] A79-38058

FLOW VISUALIZATION

Making fluid flows visible
A79-36373

FLUID DYNAMICS

Radial equilibrium in axial turbomachines
A79-37828
Aerodynamics
[NASA-TT-F-765] N79-23908

FLUID FLOW

Lectures on hydroaeromechanics --- Russian book
A79-36347

FLUID MECHANICS

Aerodynamics
[NASA-TT-F-765] N79-23908

FLUTTER ANALYSIS

Aeroelastic stability analysis of the AD-1 manned oblique-wing aircraft
A79-38136
Determination of subcritical frequency and damping from B-1 flight flutter test data
[NASA-CR-3152] N79-25426

FLY BY WIRE CONTROL

Fault-tolerant, high reliability electronic engine control system
[AIAA PAPER 79-1202] A79-38983

FORGING

Advanced forging process for gas turbine engine fan blades
[AIAA PAPER 79-1269] A79-39013

FOSSIL FUELS

Fossil fuel heat pumps for domestic, commercial and industrial space heating
A79-37852

FRACTURE STRENGTH

Damage tolerant design - An approach to reducing the life cycle cost of gas turbine engine disks
[AIAA PAPER 79-1189] A79-38976

FRAMES

User's guide: Computer program with interactive graphics for analysis of plane frame structures (CFRAME)
[AD-A067349] N79-25428

FREE FLIGHT

The science and technology of low speed and motorless flight, part 1
[NASA-CP-2085] N79-23889

FREE JETS

Velocity slip and temperature difference of gas mixtures in quasi-one-dimensional nozzle flows
A79-36423
Application of Laser Doppler Anemometry to aeroacoustic research
A79-39500

FREE MOLECULAR FLOW

Profile of a nozzle shaping the free-molecule flow intended to investigate air-intakes and cascades
A79-36122

FREEZING

Design and evaluation of aircraft heat source systems for use with high-freezing point fuels
[NASA-CR-159568] N79-24172

FREQUENCIES

Optimum frequencies for aircraft classification
[AD-A065697] N79-24220

FRETTING

Fretting fatigue, with reference to aircraft structures
[SAE PAPER 790612] A79-36741

FRICTION FACTOR

A tire runway interface friction prediction model concept
A79-38137

SUBJECT INDEX

GAS TURBINE ENGINES

FUEL COMBUSTION

- Detonation characteristics of Soviet GOST 1012-72 aviation gasoline
[SAE PAPER 790630] A79-36757
- Possil fuel heat pumps for domestic, commercial and industrial space heating A79-37852
- The effect of hydrogen addition on ignition delays and flame propagation in spark ignition engines A79-38387
- Ignition of liquid fuel jets in a supersonic air stream
[AIAA PAPER 79-1238] A79-38997
- Premixed Prevaporized Combustor Technology Forum
[NASA-CP-2078] N79-24994
- Autoignition of fuels N79-25001
- Effect of fuel/air nonuniformity on nitric oxide emissions N79-25004

FUEL CONSUMPTION

- Manufacturers developing fuel-efficient engines A79-36380
- Concepts for reducing exhaust emissions and fuel consumption of the aircraft piston engine
[SAE PAPER 790605] A79-36737
- Changing requirements in aircraft design A79-37044
- Turbo-fan design for general aviation - The evolution of the RB.401
[AIAA PAPER 79-1160] A79-38966

FUEL CONTAMINATION

- Formation of water-fuel emulsions in tanks of grounded aircraft A79-36587

FUEL FLOW REGULATORS

- Lean stability augmentation for premixing, prevaporizing combustors
[AIAA PAPER 79-1319] A79-39035

FUEL INJECTION

- The effect of hydrogen addition on ignition delays and flame propagation in spark ignition engines A79-38387
- Ignition of liquid fuel jets in a supersonic air stream
[AIAA PAPER 79-1238] A79-38997
- Autoignition of hydrogen injected transverse to a supersonic airstream
[AIAA PAPER 79-1239] A79-39818

FUEL PUMPS

- A canister fuel pump for general aviation aircraft
[SAE PAPER 790624] A79-36752

FUEL SPRAYS

- The effect of fuel sprays on emissions from a gas turbine combustor
[AIAA PAPER 79-1321] A79-39037

FUEL TANKS

- Formation of water-fuel emulsions in tanks of grounded aircraft A79-36587
- Crash-resistant fuel systems for general aviation aircraft
[SAE PAPER 790592] A79-36726
- Fuel on fire - Rapid response to a military problem A79-38090
- Inflight fuel tank temperature survey data
[NASA-CR-159569] N79-23940
- Dynamic evaluation of experimental integral fuel-tank sealants, part 2
[AD-A066592] N79-25236

FUEL TESTS

- Detonation characteristics of Soviet GOST 1012-72 aviation gasoline
[SAE PAPER 790630] A79-36757

FUEL-AIR RATIO

- Lean, premixed, prevaporized combustion for aircraft gas turbine engines
[NASA-TN-79148] N79-23964
- Effect of degree of fuel vaporization upon emissions for a premixed prevaporized combustion system --- for gas turbine engines
[NASA-TN-79154] N79-23965
- Effect of fuel/air nonuniformity on nitric oxide emissions N79-25004

FULL SCALE TESTS

- Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics
[SAE PAPER 790589] A79-36723
- Full-scale wind-tunnel investigation of an Ayres S2R-800 Thrush Agricultural Airplane
[SAE PAPER 790618] A79-36746
- Assessment at full scale of nozzle/wing geometry effects on OTW aeroacoustic characteristics --- Over The Wing STOL engine configurations A79-39802

FUSELAGES

- Differential method of designing rational aircraft frames made of composite materials A79-36592
- Identification of voltage transients on aircraft cabling under LTA excitation --- Lightning Transient Analysis A79-38531
- Fuselage-mounted antenna code: User's manual
[AD-A065587] N79-24215
- Composite forward fuselage systems integration, volume 2 --- effects of lightning
[AD-A066560] N79-24984

G

GAMMA RAYS

- Observation of atmospheric interactions at aeroplane altitude --- gamma ray emulsion experiments A79-37573

GAS DYNAMICS

- Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas --- for aircraft auxiliary power systems A79-36583

Aerodynamics

- [NASA-TT-P-765] N79-23908

GAS FLOW

- Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927
- Allowing for the wall boundary layer in an axial compressor stage A79-36586

GAS INJECTION

- Effects of air injection on a turbocharged Teledyne Continental Motors TS10-360-C engine
[SAE PAPER 790607] A79-36760
- A starter for gas turbine engines A79-36797

GAS MIXTURES

- Velocity slip and temperature difference of gas mixtures in quasi-one-dimensional nozzle flows A79-36423
- Lean, premixed, prevaporized combustion for aircraft gas turbine engines
[NASA-TN-79148] N79-23964
- Effect of degree of fuel vaporization upon emissions for a premixed prevaporized combustion system --- for gas turbine engines
[NASA-TN-79154] N79-23965
- Effect of fuel/air nonuniformity on nitric oxide emissions N79-25004

GAS TEMPERATURE

- Velocity slip and temperature difference of gas mixtures in quasi-one-dimensional nozzle flows A79-36423

GAS TURBINE ENGINES

- Directionally solidified blades - Greater strength A79-36248
- Influence of the flow angle on the characteristics of an elbow-shaped air intake --- of gas turbine engines A79-36585
- Effects of air injection on a turbocharged Teledyne Continental Motors TS10-360-C engine
[SAE PAPER 790607] A79-36760
- A starter for gas turbine engines A79-36797
- The effect of hydrogen addition on ignition delays and flame propagation in spark ignition engines A79-38387

GAS TURBINES

SUBJECT INDEX

- A method of reducing aircraft turbine blade vibrations
A79-38819
- Infrared signature measurement techniques and simulation methods for aircraft survivability
[AIAA PAPER 79-1186] A79-38975
- Damage tolerant design - An approach to reducing the life cycle cost of gas turbine engine disks
[AIAA PAPER 79-1189] A79-38976
- Development of a gas turbine combustor dilution zone design analysis
[AIAA PAPER 79-1194] A79-38979
- Analysis of the impact of the use of broad specification fuels on combustors for commercial aircraft gas turbine engines
[AIAA PAPER 79-1195] A79-38980
- The monorotor gas turbine
[AIAA PAPER 79-1230] A79-38994
- Lean, premixed, prevaporized combustion for aircraft gas turbine engines
[AIAA PAPER 79-1318] A79-39034
- Lean stability augmentation for premixing, prevaporizing combustors
[AIAA PAPER 79-1319] A79-39035
- The effect of fuel sprays on emissions from a gas turbine combustor
[AIAA PAPER 79-1321] A79-39037
- Emission characteristics of a premix combustor fueled with a simulated partial-oxidation product gas
[AIAA PAPER 79-1322] A79-39038
- Materials and structural aspects of advanced gas-turbine helicopter engines
A79-39804
- Lean, premixed, prevaporized combustion for aircraft gas turbine engines
[NASA-TM-79148] N79-23964
- Effect of degree of fuel vaporization upon emissions for a premixed prevaporized combustion system --- for gas turbine engines
[NASA-TM-79154] N79-23965
- Premixed Prevaporized Combustor Technology Forum
[NASA-CP-2078] N79-24994
- Turbulence characteristics of compressor discharge flows --- JT9D engine tests
N79-24995
- Turbulence measurements in the compressor exit flow of a General Electric CF6-50 engine
N79-24996
- Advanced low emissions catalytic combustor program at General Electric
N79-25011
- Internally coated air-cooled gas turbine blading
[NASA-CR-159574] N79-25018
- Industry tests of NASA ceramic thermal barrier coating --- for gas turbine engine applications
[NASA-TP-1425] N79-25023
- Brittle materials design, high temperature gas turbine: Ceramic turbine rotor technology
[AD-A067176] N79-25029
- GAS TURBINES**
- Application of advanced data reduction methods to gas turbine dynamic analysis
A79-36024
- Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas --- for aircraft auxiliary power systems
A79-36583
- Effectiveness of readmission of the gas in high-pressure-ratio small-scale turbines --- for aircraft auxiliary power systems
A79-36584
- Turbine design system
[AD-A066092] N79-23974
- Fundamentals of Gas Turbine combustion
[NASA-CP-2087] N79-25016
- GASEOUS FUELS**
- Fossil fuel heat pumps for domestic, commercial and industrial space heating
A79-37852
- Emission characteristics of a premix combustor fueled with a simulated partial-oxidation product gas
[AIAA PAPER 79-1322] A79-39038
- GASOLINE**
- Detonation characteristics of Soviet GOST 1012-72 aviation gasoline
[SAE PAPER 790630] A79-36757
- Stability characteristics of hydrocarbon fuels from alternative sources
[BETC/RI-78/23] N79-24178
- GENERAL AVIATION AIRCRAFT**
- Evaluation of GPS performance for low-cost general aviation
A79-36065
- Effects of a spin chute installation on spin characteristics --- of light general aviation aircraft
[SAE PAPER 790564] A79-36705
- Spin flight research summary
[SAE PAPER 790565] A79-36706
- A Demonstration Advanced Avionics System for general aviation
[SAE PAPER 790569] A79-36709
- The design and selection of optimum propellers for general aviation aircraft
[SAE PAPER 790575] A79-36711
- The analysis of propellers including interaction effects --- for general aviation aircraft
[SAE PAPER 790576] A79-36712
- Design description of a four-place business jet using two WR-19 engines
[SAE PAPER 790580] A79-36715
- The Learjet 'Longhorn' series - The first jets with winglets
[SAE PAPER 790581] A79-36716
- Improving business jet performance - The Mark Five Sabreliner
[SAE PAPER 790582] A79-36717
- A general aviation flight test application of the on-board computer
[SAE PAPER 790583] A79-36718
- Design of quiet efficient propellers
[SAE PAPER 790584] A79-36719
- Crashworthiness analysis of field investigation of business aircraft accidents
[SAE PAPER 790587] A79-36721
- NASA general aviation crashworthiness seat development
[SAE PAPER 790591] A79-36725
- Propeller aircraft noise around general aviation airports
[SAE PAPER 790594] A79-36728
- Preliminary QCGAT program test results --- Quiet, Clean General Aviation Turbofan
[SAE PAPER 790596] A79-36729
- Advanced braking controls for business aircraft
[SAE PAPER 790599] A79-36731
- Canadair Challenger flight test status
[SAE PAPER 790602] A79-36734
- Concepts for reducing exhaust emissions and fuel consumption of the aircraft piston engine
[SAE PAPER 790605] A79-36737
- New technologies for general aviation aircraft
[SAE PAPER 790613] A79-36742
- General aviation aircraft design for performance using small computers
[SAE PAPER 790614] A79-36743
- Development of the Beechcraft Model 77
[SAE PAPER 790617] A79-36745
- New opportunities for future small civil turbine engines - Overviewing the GATE studies
[SAE PAPER 790619] A79-36747
- Rolls-Royce RB.401-07 turbofan engine for business aircraft in the 1980's
[SAE PAPER 790620] A79-36748
- A review of Curtiss-Wright rotary engine developments with respect to general aviation potential
[SAE PAPER 790621] A79-36749
- Electromechanical actuation for business aircraft
[SAE PAPER 790622] A79-36750
- A comparison of hydraulic, pneumatic, and electro-mechanical actuators for general aviation flight controls
[SAE PAPER 790623] A79-36751
- A canister fuel pump for general aviation aircraft
[SAE PAPER 790624] A79-36752
- Engine induced structural-borne noise in a general aviation aircraft
[SAE PAPER 790626] A79-36754
- Summary of noise reduction characteristics of typical general aviation materials
[SAE PAPER 790627] A79-36755
- Some main points about general-aviation design practice
A79-37047

- The dynamics of a general aviation pilot promotion campaign
A79-38886
- General aviation turbine engine /GATE/ concepts
[AIAA PAPER 79-1157] A79-38964
- Turbo-fan design for general aviation - The evolution of the RB.401
[AIAA PAPER 79-1160] A79-38966
- The application of the Prop-Fan concept in preliminary design of a very advanced technology light twin /VATLIT '85/
[AIAA PAPER 79-1343] A79-39047
- A review of the icing situation from the standpoint of general aviation
N79-23918
- Low-speed wind tunnel results for a modified 13-percent-thick airfoil
[NASA-TM-X-74018] N79-24960
- Advanced General Aviation Turbine Engine (GATE) concepts
[NASA-CR-159603] N79-25017
- GEOMETRY**
Introduction to the arcopter arc wing and the Bertelsen effect for positive pitch stability and control
N79-23895
- GLIDERS**
A case study in design - The Gossamer Condor
A79-37050
- An exploratory investigation of the effect of plastic coating on the profile drag of a practical-metal-construction sailplane airfoil
N79-23891
- Optimum tail plane design for sailplanes
N79-23892
- The application of microprocessor technology to in-flight computation
N79-23902
- Design of propellers for motorsoarers
N79-23903
- GLIDING**
The science and technology of low speed and motorless flight, part 1
[NASA-CP-2085] N79-23889
- GLOBAL POSITIONING SYSTEM**
Evaluation of GPS performance for low-cost general aviation
A79-36065
- Loran C - Its future in the shadow of Navstar GPS
A79-36071
- A navigation filter for an integrated GPS/JTIDS/INS system for a tactical aircraft --- Joint Tactical Information Distribution System
A79-36087
- Recent results in navigation systems utilizing signal aiding from Navstar satellites
A79-36096
- GRAPHS (CHARTS)**
The Rockwell International Sabreliner-65: Case study in aircraft design --- Book
A79-36645

[SAE PAPER 790590] A79-36724
- A study of the evolution of noise exposure under different hypotheses of regulation
[ONERA, TP NO. 1979-44] A79-39093
- GROUND EFFECT**
Methodology for prediction of V/STOL propulsion induced forces in ground effect
[AIAA PAPER 79-1281] A79-39017
- GROUND EFFECT (AERODYNAMICS)**
Investigation of a laser Doppler velocimeter system to measure the flow field of a large scale V/STOL aircraft in ground effect
[AIAA PAPER 79-1184] A79-38974
- GROUND SUPPORT EQUIPMENT**
High level maintenance below sea level
A79-38825
- GROUND TESTS**
Method of assessment of the antistatic protection of aircraft
[ONERA, TP NO. 1979-41] A79-39090
- GROUND WIND**
Ground winds for Kennedy Space Center, Florida, 1979 revision
[NASA-TM-78229] N79-25662
- GUIDANCE (MOTION)**
A system for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation
[NASA-CASE-PHC-11005-1] N79-24988
- GUNS (ORDNANCE)**
Precision controllability of the F-15 airplane
[NASA-TM-72861] N79-23979
- GUST LOADS**
Analysis of an unsteady aerodynamic force on a blade due to ununiform amplitude gusts
A79-39059
- H**
- HARRIER AIRCRAFT**
The British Aerospace Harrier: Case study in aircraft design --- Book
A79-36644
- Is the AV-8B Advanced Harrier aircraft ready for full-scale development
[PB-290826/7] N79-24987
- HAZARDS**
Factors affecting electrostatic hazards
[AD-A066927] N79-25245
- HEAD-UP DISPLAYS**
Energy maneuverability display validation --- F-16 aircraft
[AFPD-LTR-78-35-VOL-1] N79-23947
- HEAT PUMPS**
Possil fuel heat pumps for domestic, commercial and industrial space heating
A79-37852
- A cooling system for an aircraft having a cruise range from Mach 2 to Mach 8
[NASA-CASE-LAR-12406-1] N79-24980
- HEAT RESISTANT ALLOYS**
Directionally solidified blades - Greater strength
A79-36248
- The application of rapid solidification rate superalloys to radial wafer turbine blades
[AIAA PAPER 79-1226] A79-38991
- HEAT SHIELDING**
Transient ablation of Teflon in intense radiative and convective environments
A79-38123
- HEAT SOURCES**
Design and evaluation of aircraft heat source systems for use with high-freezing point fuels
[NASA-CR-159568] N79-24172
- HEIGHT**
Theoretical fundamentals of radio altimetry --- Russian book
A79-38145
- HELICOPTER CONTROL**
Model study of transient processes in a hydraulic power amplifier
A79-38814
- Evaluation of a digital helicopter control system --- BO-105 helicopter
[MBB-UPE-1349-0] N79-23980
- HELICOPTER DESIGN**
Composite applications at Bell Helicopter
[SAE PAPER 790578] A79-36713
- Interactional aerodynamics of the single rotor helicopter configuration. Volume 2B: Harmonic analyses of airframe surface pressure data, runs 7 - 14, midsection

HYPERSONIC AIRCRAFT

A cooling system for an aircraft having a cruise range from Mach 2 to Mach 8
[NASA-CASE-LAR-12406-1] N79-24980

HYPERSONIC FLIGHT

Autoignition of hydrogen injected transverse to a supersonic airstream
[AIAA PAPER 79-1239] A79-39818

HYPERSONIC FLOW

Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927
Measurement of the drag of slender cones in hypersonic flow at low Reynolds numbers using a magnetic suspension and balance
[OUEL-1235/78] N79-23938

ICE FORMATION

Aircon electrically heated acrylic --- for ice formation prevention on aircraft transparencies
[SAE PAPER 790600] A79-36732
Aircraft icing
[NASA-CF-2086] N79-23912
Aircraft icing: Introduction N79-23913
Executive summary of Aircraft Icing Specialists Workshop N79-23914
Icing of aircraft Some remarks with an historical slant from a cloud physicist N79-23915
Safety hazard of aircraft icing N79-23916
Civil Helicopter icing problems N79-23917
A review of the icing situation from the standpoint of general aviation N79-23918
Overview of helicopter ice protection system developments N79-23919

IDENTIFYING

Some possible applications of identification theory techniques in telemetry --- for aircraft communication A79-36589

IGNITION

Autoignition of fuels N79-25001

IGNITION LIMITS

Autoignition of hydrogen injected transverse to a supersonic airstream
[AIAA PAPER 79-1239] A79-39818

IGNITION SYSTEMS

Dual breakerless aircraft magneto
[SAE PAPER 790606] A79-36738

IMPACT DAMAGE

Damage-tolerant fan blade design
[AIAA PAPER 79-1119] A79-38951

IMPACT TESTS

Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics
[SAE PAPER 790589] A79-36723
Seat/occupant crash dynamic analysis verification test program
[SAE PAPER 790590] A79-36724
NASA general aviation crashworthiness seat development
[SAE PAPER 790591] A79-36725
Crash-resistant fuel systems for general aviation aircraft
[SAE PAPER 790592] A79-36726

IMPACT TOLERANCES

Damage-tolerant fan blade design
[AIAA PAPER 79-1119] A79-38951

IN-FLIGHT MONITORING

Inflight fuel tank temperature survey data
[NASA-CR-159569] N79-23940

INERTIAL NAVIGATION

Reliability, performance, and fault isolation considerations in the design of interconnected navigation systems A79-36077

A navigation filter for an integrated GPS/JTIDS/INS system for a tactical aircraft --- Joint Tactical Information Distribution System A79-36087

INERTIAL REFERENCE SYSTEMS

Inertial Referenced Flight Inspection System A79-37150

INFORMATION THEORY

Some possible applications of identification theory techniques in telemetry --- for aircraft communication A79-36589

INFRARED RADIATION

Infrared signature measurement techniques and simulation methods for aircraft survivability
[AIAA PAPER 79-1186] A79-38975

INFRARED SPECTROMETERS

Infrared signature measurement techniques and simulation methods for aircraft survivability
[AIAA PAPER 79-1186] A79-38975

INGESTION (ENGINES)

Damage-tolerant fan blade design
[AIAA PAPER 79-1119] A79-38951
V/STOL aircraft configuration effects on exhaust gas ingestion
[AIAA PAPER 79-1284] A79-39019

INHIBITORS

Water absorption of fluids/oils --- contamination of aircraft engine oils and inhibitors
[AD-A065915] N79-24158

INLET FLOW

Combined pressure and temperature distortion effects on internal flow of a turbofan engine
[AIAA PAPER 79-1309] A79-39031
Effect of steady-state pressure distortion on flow characteristics entering a turbofan engine
[NASA-TN-79134] N79-23969
Self stabilizing sonic inlet
[NASA-CASE-LEW-11890-1] N79-24976

INLET NOZZLES

Theoretical fan velocity distortions due to inlets and nozzles --- in V/STOL aircraft
[NASA-TN-79150] N79-23911

INLET PRESSURE

Predicted F100 engine response to circumferential pressure and temperature distortion
[AIAA PAPER 79-1310] A79-39819

INSPECTION

High level maintenance below sea level A79-38825
Small hole drilling and inspection with pulsed laser systems --- in air-cooled aircraft engine structures
[AIAA PAPER 79-1268] A79-39012
Non-destructive inspection methods for propulsion systems and components
[AGARD-LS-103] N79-25412
State-of-the-art of nondestructive inspection of aircraft engines N79-25413
High resolution radiography in the aero-engine industry N79-25414
Non-destructive methods for the early detection of fatigue damage in aircraft components N79-25417
Broad-band transducers for nondestructive inspection of aeronautical components N79-25419

INSTRUMENT LANDING SYSTEMS

Inertial Referenced Flight Inspection System A79-37150

INTAKE SYSTEMS

Theoretical fan velocity distortions due to inlets and nozzles --- in V/STOL aircraft
[NASA-TN-79150] N79-23911

INTEGRAL EQUATIONS

Construction of an initial approximation for the solution of the integral equation of a lifting surface A79-35928

INTERCEPTION

The intercept of covert radar A79-38132

INTERFERENCE DRAG

A parametric study of support system interference effects on nozzle/afterbody throttle dependent drag in wind tunnel testing
[AIAA PAPER 79-1168] A79-38968

INTERNAL PRESSURE

Combined pressure and temperature distortion effects on internal flow of a turbofan engine
[AIAA PAPER 79-1309] A79-39031

INTERNATIONAL COOPERATION

Internationalization of OMEGA A79-36069
Development of an airborne military system (MRCA) (system)
[MBB-UPE-1322-0] N79-23904

INTERNATIONAL TRADE

Joint Airworthiness Requirements - Their history and progress A79-37149

INTERPOLATION

Time optimal control of a jet engine using a quasi-Hermite interpolation model
[NASA-CR-158711] N79-25019

INVISCID FLOW

Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927
Numerical calculation of inviscid transonic flow through rotors and fans N79-23906

ISOTHERMAL PROCESSES

Advanced forging process for gas turbine engine fan blades
[AIAA PAPER 79-1269] A79-39013

ITALY

Research and development activities in Italy in the field of aerospace structures and materials
[AGARD-R-675] N79-24202

ITERATION

Construction of an initial approximation for the solution of the integral equation of a lifting surface A79-35928

J

J-85 ENGINE

Effects of steady-state pressure distortion on the stall margin of a J85-21 turbojet engine
[NASA-TM-79123] N79-23968

JET AIRCRAFT

The effects of low-level wind shear on the approach and go-around performance of a landing jet aircraft
[SAE PAPER 790568] A79-36708
Canadaair Challenger flight test status
[SAE PAPER 790602] A79-36734

JET AIRCRAFT NOISE

Effects of forward velocity on sound radiation from convecting monopole and dipole sources in jet flow --- subsonic aircraft model A79-38393
Application of Laser Doppler Anemometry to aeroacoustic research A79-39500
An improved method for predicting the effects of flight on jet mixing noise A79-39803

Detection of low flying aircraft by acoustical means [REPT-8-78] N79-24779

Assessment at full scale of nozzle/wing geometry effects on OTW aero-acoustic characteristics --- short takeoff aircraft noise
[NASA-TM-79168] N79-25841

Validation of aircraft noise prediction program [NASA-CR-159047] N79-25843

JET ENGINE FUELS

Analysis of the impact of the use of broad specification fuels on combustors for commercial aircraft gas turbine engines
[AIAA PAPER 79-1195] A79-38980
Stability characteristics of hydrocarbon fuels from alternative sources
[BETC/RI-78/23] N79-24178
The impact of alternate fuels on aircraft configuration characteristics --- military aircraft
[AD-A066983] N79-25244
A filterability study of corrosion inhibited JP-4
[AD-A066887] N79-25247

JET ENGINES

Time optimal control of a jet engine using a quasi-Hermite interpolation model
[NASA-CR-158711] N79-25019

Design study and performance analysis of a high-speed multistage variable-geometry fan for a variable cycle engine
[NASA-CR-159545] N79-25020

JET EXHAUST

Aircraft air pollution emission estimation techniques, ACEE
[AD-A067262] N79-25550

JET FLOW

Effects of forward velocity on sound radiation from convecting monopole and dipole sources in jet flow --- subsonic aircraft model A79-38393

JET MIXING FLOW

Development of a gas turbine combustor dilution zone design analysis
[AIAA PAPER 79-1194] A79-38979
Ignition of liquid fuel jets in a supersonic air stream
[AIAA PAPER 79-1238] A79-38997
An improved method for predicting the effects of flight on jet mixing noise A79-39803

JET VANES

Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N79-23971

K

KELVIN-HELMHOLTZ INSTABILITY

The 'cloud-in-cell' technique applied to the roll up of vortex sheets A79-37725

KEVLAR (TRADEMARK)

Development of an aircraft composite propeller
[SAE PAPER 790579] A79-36714

L

LAMINAR BOUNDARY LAYER

A method for the calculation of 3D boundary layers on practical wing configurations A79-38906

LAMINAR FLOW

Calculation of a laminar wall jet in a wake A79-36582

LAMINAR WAKES

Calculation of a laminar wall jet in a wake A79-36582

LAMINATES

Bonding and durability --- for airframe structures
[SAE PAPER 790561] A79-36702
Engine demonstration test of a cooled laminated axial turbine
[AIAA PAPER 79-1229] A79-38993
A variational theorem for laminated composite plates of nonlinear materials and applications to postbuckling N79-24977

LANDING GEAR

An electric control for an electrohydraulic active control aircraft landing gear
[NASA-CR-3113] N79-23948

LANDING LOADS

Proper aircraft tire size selection - Optimum performance with minimum maintenance
[SAE PAPER 790598] A79-36730

LASER ANEMOMETERS

Turbulent wake measurements with a laser velocimeter
[AIAA PAPER 79-1087] A79-38058

LASER APPLICATIONS

Air Force Space Laser Communications A79-38706

Small hole drilling and inspection with pulsed laser systems --- in air-cooled aircraft engine structures
[AIAA PAPER 79-1268] A79-39012

LASER DOPPLER VELOCIMETERS

Investigation of a laser Doppler velocimeter system to measure the flow field of a large scale V/STOL aircraft in ground effect
[AIAA PAPER 79-1184] A79-38974
Application of Laser Doppler Anemometry to aeroacoustic research A79-39500

- LASER DRILLING**
Small hole drilling and inspection with pulsed laser systems --- in air-cooled aircraft engine structures
[AIAA PAPER 79-1268] A79-39012
- LATERAL STABILITY**
An annular wing
[NASA-CASE-PRC-11007-2] N79-24959
- LEADING EDGES**
Supersonic flow in the area of antisymmetric thin cruciform wings with supersonic leading edges in a horizontal plane, with consideration of flow separation on the edges
[AD-A065993] N79-23929
- LEAR JET AIRCRAFT**
The Learjet 'Longhorn' series - The first jets with winglets
[SAE PAPER 790581] A79-36716
- LECTURES**
Non-destructive inspection methods for propulsion systems and components
[AGARD-LS-103] N79-25412
- LIFE (DURABILITY)**
Composite applications at Bell Helicopter
[SAE PAPER 790578] A79-36713
Cost benefits from improved hot section life prediction technology --- for aircraft engine combustor and turbine parts
[AIAA PAPER 79-1154] A79-38963
- LIFE CYCLE COSTS**
Changing requirements in aircraft design
A79-37044
Damage tolerant design - An approach to reducing the life cycle cost of gas turbine engine disks
[AIAA PAPER 79-1189] A79-38976
The monorotor gas turbine
[AIAA PAPER 79-1230] A79-38994
Development of in-flight steady-state failure rates
A79-39912
Lower avionics temperature - Lower life cycle cost
A79-39914
Reliability and maintainability contribution to Hornet mission success
A79-39915
Advanced General Aviation Turbine Engine (GATE) concepts
[NASA-CR-159603] N79-25017
Life cycle cost analysis concepts and procedures
N79-25408
Recent experience in the development and application of LCC models
N79-25410
- LIFT**
Conversion of wing surface pressures into normalized lift coefficient
[SAE PAPER 790567] A79-36707
Analysis of an unsteady aerodynamic force on a blade due to nonuniform amplitude gusts
A79-39059
Generation and breakdown of aerodynamic lift: Physical mechanism
N79-23894
Polar lift and drag determination during flight tests
[NBB-UFFE-1410-0] N79-24986
- LIFT DRAG RATIO**
An annular wing
[NASA-CASE-PRC-11007-2] N79-24959
- LIFTING BODIES**
Construction of an initial approximation for the solution of the integral equation of a lifting surface
A79-35928
Factors influencing the accuracy of aerodynamic hinge-moment prediction
[AD-A066606] N79-24965
- LIGHT AIRCRAFT**
Industry seeks lighter aircraft weight --- aircraft design performance
A79-36100
Producing light aircraft - Three viability case studies
A79-36376
Effects of a spin chute installation on spin characteristics --- of light general aviation aircraft
[SAE PAPER 790564] A79-36705
- Conversion of wing surface pressures into normalized lift coefficient
[SAE PAPER 790567] A79-36707
Nonlinear structural crash dynamics analyses
[SAE PAPER 790588] A79-36722
Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics
[SAE PAPER 790589] A79-36723
Seat/occupant crash dynamic analysis verification test program
[SAE PAPER 790590] A79-36724
Crash-resistant fuel systems for general aviation aircraft
[SAE PAPER 790592] A79-36726
A new light twin using bonded metal construction
[SAE PAPER 790603] A79-36735
An experimental study of propeller-induced structural vibration and interior noise
[SAE PAPER 790625] A79-36753
Summary of noise reduction characteristics of typical general aviation materials
[SAE PAPER 790627] A79-36755
A case study in design - The Gossamer Condor
A79-37050
Digital flight control research using microprocessor technology
A79-38533
Electric propulsion for high performance light aircraft
[AIAA PAPER 79-1265] A79-39011
Exhaust emissions characteristics for a general aviation light-aircraft Avco Lycoming 10-360-A1B6D piston engine
[AD-A066556] N79-25544
Exhaust emissions characteristics for a general aviation light-aircraft Avco-Lycoming 10-360-B1BD piston engine
[AD-A066589] N79-25545
- LIGHTNING**
The estimation of induced-voltage peak magnitude and energy level under LTA/EMP excitation of low-loss aircraft cabling --- Lightning Transit Analysis/Electro-Magnetic Pulse
A79-37238
The McDonnell Aircraft Company Lightning Simulation Laboratory
A79-37294
Composite forward fuselage systems integration, volume 2 --- effects of lightning
[AD-A066560] N79-24984
- LIGHTNING SUPPRESSION**
Identification of voltage transients on aircraft cabling under LTA excitation --- Lightning Transient Analysis
A79-38531
- LIQUID INJECTION**
Ignition of liquid fuel jets in a supersonic air stream
[AIAA PAPER 79-1238] A79-38997
- LOAD DISTRIBUTION (FORCES)**
Minimization theory of induced drag subject to constraint conditions
[NASA-CR-3140] N79-23923
- LOGIC CIRCUITS**
The operational impact of Navy's first TAAF program --- P-3C Test, Analyze and Fix
A79-39890
- LOGIC DESIGN**
Multivariable control altitude demonstration on the F100 turbofan engine
[AIAA PAPER 79-1204] A79-39814
- LOGISTICS**
Cargo Logistics Airlift Systems Study (CLASS). Volume 2: Case study approach and results
[NASA-CR-158913] N79-24978
- LONG TERM EFFECTS**
The effect of endless burn-in on reliability growth projections --- for solid state aviation electronics equipment
A79-39920
- LONGITUDINAL STABILITY**
An annular wing
[NASA-CASE-PRC-11007-2] N79-24959
- LORAN C**
Loran C - Its future in the shadow of Navstar GPS
A79-36071

LOW ALTITUDE

SUBJECT INDEX

LOW ALTITUDE

- Detection of low flying aircraft by acoustical means
[REPT-8-78] N79-24779
- Technical evaluation report on the 25th Guidance
and Control Panel Symposium on guidance and
Control Design Considerations for Low Altitude
and Terminal Area Flight
[AGARD-AR-129] N79-25037
- LOW COST**
- Evaluation of GPS performance for low-cost general
aviation A79-36065
- Some main points about general-aviation design
practice A79-37047
- LOW LEVEL TURBULENCE**
- The effects of low-level wind shear on the
approach and go-around performance of a landing
jet aircraft
[SAE PAPER 790568] A79-36708
- LOW SPEED**
- The science and technology of low speed and
motorless flight, part 1
[NASA-CP-2085] N79-23889
- Low-speed single-element airfoil synthesis
N79-23890
- Generation and breakdown of aerodynamic lift:
Physical mechanism N79-23894
- Introduction to the arcopter arc wing and the
Bertelsen effect for positive pitch stability
and control N79-23895
- LOW SPEED WIND TUNNELS**
- Low-speed wind tunnel results for a modified
13-percent-thick airfoil
[NASA-TM-X-74018] N79-24960
- LUBRICANT TESTS**
- Effects of extended oil changes on aircraft piston
engine wear and oil characteristics
[SAE PAPER 790629] A79-36756
- LUBRICATING OILS**
- Effects of extended oil changes on aircraft piston
engine wear and oil characteristics
[SAE PAPER 790629] A79-36756
- Diagnostics of wear in aeronautical systems
A79-39805
- Water absorption of fluids/oils --- contamination
of aircraft engine oils and inhibitors
[AD-A065915] N79-24158
- Aircraft engine oil analysis by neutron activation
techniques
[AD-A066202] N79-24169
- LUBRICATION SYSTEMS**
- Dry friction in the aerospace industry
A79-39873

M

MAGNETIC INDUCTION

- Analytical modeling of the dynamics of brushless
dc motors for aerospace applications: A
conceptual framework
[NASA-TM-80445] N79-25310

MAGNETIC RIGIDITY

- Vertical cutoff rigidity and the intensity
distribution of cosmic rays near Cape Town
A79-37468

MAGNETIC SUSPENSION

- Measurement of the drag of slender cones in
hypersonic flow at low Reynolds numbers using a
magnetic suspension and balance
[OUEL-1235/78] N79-23938

MAINTAINABILITY

- The F-16 RIW program --- Reliability Improvement
Warranty A79-39889
- Lower avionics temperature - Lower life cycle cost
A79-39914
- Reliability and maintainability contribution to
Hornet mission success A79-39915

MAINTENANCE

- The test pilot in the airline industry or 'My bags
are packed and I'm ready to go'
A79-38478
- Evaluation of materials for post-attack pavement
repair
[AD-A066516] N79-25251

HAN MACHINE SYSTEMS

- Computer graphics create the new wave of design
A79-37046
- Tachystoscopic testing of onboard instruments
A79-38817

HAN OPERATED PROPULSION SYSTEMS

- A case study in design - The Gossamer Condor
A79-37050

MANAGEMENT PLANNING

- Life cycle cost analysis concepts and procedures
N79-25408

MANUAL CONTROL

- Sidestick/Throttle Controller - An alternate
approach A79-38476

MANUALS

- VOLAR: A digital computer program for simulating
VSTOL aircraft launch and recover from small
ships. Volume 2: Appendices
[AD-A066173] N79-23955

MARKET RESEARCH

- Some main points about general-aviation design
practice A79-37047

MARKETING

- Airbus picks up speed - and the junior A310 takes
off A79-36774

MATERIALS TESTS

- Installation for studying fatigue strength of
materials in acoustic loading --- for aircraft
skins A79-39070

MATHEMATICAL MODELS

- Some possible applications of identification
theory techniques in telemetry --- for aircraft
communication A79-36589

- Design of quiet efficient propellers
[SAE PAPER 790584] A79-36719

- A comparison of hydraulic, pneumatic, and
electro-mechanical actuators for general
aviation flight controls
[SAE PAPER 790623] A79-36751

- A tire runway interface friction prediction model
concept A79-38137

- Development of a gas turbine combustor dilution
zone design analysis
[AIAA PAPER 79-1194] A79-38979

- Methodology for prediction of V/STOL propulsion
induced forces in ground effect
[AIAA PAPER 79-1281] A79-39017

- Development of in-flight steady-state failure rates
A79-39912

- The production function and airframe cost estimation
[AD-A065570] N79-23952

- A simplified rotor system mathematical model for
piloted flight dynamics simulation
[NASA-TM-78575] N79-23977

- Recent experience in the development and
application of LCC models N79-25410

MATHEMATICAL PROGRAMMING

- Wing shape optimization for maximum cross-country
speed, with mathematical programming N79-23899

MATRICES (MATHEMATICS)

- An aircraft simulation using a product of
exponentials as matrizant A79-38885

MECHANICAL DRIVES

- Electromechanical actuation for business aircraft
[SAE PAPER 790622] A79-36750

- Driveshaft alignment indicator
[AD-A065988] N79-23973

MECHANICAL PROPERTIES

- Generation and breakdown of aerodynamic lift:
Physical mechanism N79-23894

METAL BONDING

- A new light twin using bonded metal construction
[SAE PAPER 790603] A79-36735

METAL FATIGUE

- Application of electron-beam welding to aviation
production --- tests of turbine engine parts
welded by electron beam N79-24940

METAL SURFACES

X-ray determination of internal stress states due to surface treatment of TiAl6V4 and TiAl6V6Sn2
A79-36003

METAL-METAL BONDING

Bonding and durability --- for airframe structures [SAE PAPER 790561] A79-36702
Adhesive bonded structure of new pressurized piston twin aircraft [SAE PAPER 790563] A79-36704

METEOROLOGY

Forecasting the quantitative characteristics of aircraft icing [BLL-TRANS-1364-(9022.549)] N79-24971

METHOD OF CHARACTERISTICS

Airfoil optimization for transonic flow using the methods of finite elements and characteristics [NBB-UFE-1362-0] N79-23937

MICROPROCESSORS

Hyperbolic positioning per se is passe --- navigation computations from range measurements using microprocessor A79-36070

Digital flight control research using microprocessor technology A79-38533

Exploring team avionics systems by simulation A79-38882

The application of microprocessor technology to in-flight computation N79-23902

MICROWAVE INTERFEROMETERS

Satellite interferometer as an advanced navigation/communication system A79-39602

MICROWAVE LANDING SYSTEMS

Advanced braking controls for business aircraft [SAE PAPER 790599] A79-36731

MILITARY AIRCRAFT

Dassault-Breguet - The Mirage 2000 A79-36974

The impact of operational requirements on V/STOL propulsion concept selection [AIAA PAPER 79-1283] A79-39018

Development of in-flight steady-state failure rates A79-39912

Optimum frequencies for aircraft classification [AD-A065697] N79-24220

The impact of alternate fuels on aircraft configuration characteristics --- military aircraft [AD-A066983] N79-25244

MILITARY HELICOPTERS

Map-of-the-earth communication program for US Army helicopters [AD-A063089] N79-24232

MINICOMPUTERS

A general aviation flight test application of the on-board computer [SAE PAPER 790583] A79-36718

General aviation aircraft design for performance using small computers [SAE PAPER 790614] A79-36743

Aerospace computer systems. Part 1: Avionics applications, volume 2. A bibliography with abstracts [NTIS/PS-79/0312/3] N79-23959

Aerospace computer systems. Part 1: Avionics applications, volume 3. A bibliography with abstracts [NTIS/PS-79/0313/1] N79-23960

MINIMUM DRAG

Minimization theory of induced drag subject to constraint conditions [NASA-CR-3140] N79-23923

MOISTURE CONTENT

Formation of water-fuel emulsions in tanks of grounded aircraft A79-36587

MOTION SICKNESS

Motion in flight simulation: An annotated bibliography [AD-A061687] N79-25042

MOTION SIMULATORS

Motion in flight simulation: An annotated bibliography [AD-A061687] N79-25042

MOVING TARGET INDICATORS

A family of air traffic control radars A79-38532

MRCA AIRCRAFT

Development of an airborne military system (MRCA system) [NBB-UFE-1322-0] N79-23904

MTBF

Development of in-flight steady-state failure rates A79-39912

Reliability and maintainability contribution to Hornet mission success A79-39915

N**NACELLES**

Factors influencing nacelle design on the 747 [AIAA PAPER 79-1236] A79-38996

NASA PROGRAMS

NASA general aviation crashworthiness seat development [SAE PAPER 790591] A79-36725

NAVIGATION

A system for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation [NASA-CASE-FRC-11005-1] N79-24988

NAVIGATION AIDS

Hyperbolic positioning per se is passe --- navigation computations from range measurements using microprocessor A79-36070

Loran C - Its future in the shadow of Navstar GPS A79-36071

Theoretical fundamentals of radio altimetry --- Russian book A79-38145

An evaluation of turn anticipation techniques and offset flying procedures using a single-waypoint RNAV system [AD-A066555] N79-24974

NAVIGATION TECHNOLOGY SATELLITES

Recent results in navigation systems utilizing signal aiding from Navstar satellites A79-36096

NAVSTAR SATELLITES

Loran C - Its future in the shadow of Navstar GPS A79-36071

Recent results in navigation systems utilizing signal aiding from Navstar satellites A79-36096

NEAR FIELDS

High frequency near field scattering by an elliptic disk [AD-A065586] N79-24214

NETWORK ANALYSIS

The estimation of induced-voltage peak magnitude and energy level under LTA/EMP excitation of low-loss aircraft cabling --- Lightning Transit Analysis/Electro-Magnetic Pulse A79-37238

NEUTRON ACTIVATION ANALYSIS

Aircraft engine oil analysis by neutron activation techniques [AD-A066202] N79-24169

NICKEL COATINGS

Internally coated air-cooled gas turbine blading [NASA-CR-159574] N79-25018

NIGHT FLIGHTS (AIRCRAFT)

Night/Adverse Weather A-10 evaluator program A79-38479

NITRIC OXIDE

Effect of fuel/air nonuniformity on nitric oxide emissions N79-25004

Optical in situ versus probe measurements of nitric oxide concentration as a function of axial position in a combustor exhaust [AD-A067329] N79-25025

NITROGEN OXIDES

The effect of fuel sprays on emissions from a gas turbine combustor [AIAA PAPER 79-1321] A79-39037

NOISE INTENSITY

- Statistical comparisons of aircraft flyover noise adjustment procedures for different weather conditions
[NASA-TP-1430] N79-24773
- Tone noise of three supersonic helical tip speed propellers in a wind tunnel
[NASA-TM-79167] N79-25840
- NOISE MEASUREMENT**
Summary of noise reduction characteristics of typical general aviation materials
[SAE PAPER 790627] A79-36755
- A study of the evolution of noise exposure under different hypotheses of regulation
[ONERA, TP NO. 1979-44] A79-39093
- Validation of aircraft noise prediction program
[NASA-CR-159047] N79-25843
- NOISE POLLUTION**
A study of the evolution of noise exposure under different hypotheses of regulation
[ONERA, TP NO. 1979-44] A79-39093
- Aircraft sonic boom: Effects on buildings. A bibliography with abstracts
[NTIS/PS-79/0265/3] N79-24201
- NOISE PROPAGATION**
Propeller aircraft noise around general aviation airports
[SAE PAPER 790594] A79-36728
- An experimental study of propeller-induced structural vibration and interior noise
[SAE PAPER 790625] A79-36753
- Status of knowledge of sonic booms
[NASA-TM-80113] N79-24955
- NOISE REDUCTION**
Design of quiet efficient propellers
[SAE PAPER 790584] A79-36719
- The impact of noise regulations on propeller design
[SAE PAPER 790593] A79-36727
- Propeller aircraft noise around general aviation airports
[SAE PAPER 790594] A79-36728
- Preliminary QCGAT program test results --- Quiet, Clean General Aviation Turbofan
[SAE PAPER 790596] A79-36729
- Engine induced structural-borne noise in a general aviation aircraft
[SAE PAPER 790626] A79-36754
- Summary of noise reduction characteristics of typical general aviation materials
[SAE PAPER 790627] A79-36755
- Designing with damping materials to reduce noise and structural fatigue --- of aircraft components
[SAE PAPER 790631] A79-36758
- A study of the evolution of noise exposure under different hypotheses of regulation
[ONERA, TP NO. 1979-44] A79-39093
- Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N79-23971
- Aircraft sonic boom: Studies on aircraft flight, aircraft design, and measurement. A bibliography with abstracts
[NTIS/PS-79/0264/6] N79-24780
- Helicopter transmission vibration and noise reduction program. Volume 3: Evaluation of fiber FP metal-matrix housing specimens
[AD-A066794] N79-24983
- Aircraft and airport noise reduction
[GPO-29-661] N79-25038
- NOISE SPECTRA**
Statistical comparisons of aircraft flyover noise adjustment procedures for different weather conditions
[NASA-TP-1430] N79-24773
- NONDESTRUCTIVE TESTS**
Definition and non-destructive detection of critical adhesive bond-line flaws
[AD-A065584] N79-24163
- Non-destructive inspection methods for propulsion systems and components
[AGARD-LS-103] N79-25412
- State-of-the-art of nondestructive inspection of aircraft engines
N79-25413
- Non-destructive methods for the early detection of fatigue damage in aircraft components
N79-25417
- Broad-band transducers for nondestructive inspection of aeronautical components
N79-25419

NONEQUILIBRIUM FLOW

- Theory of thin wing in a supersonic flow with consideration of the non-equilibrium state of excitation of oscillating degrees of freedom
[AD-A065992] N79-23928
- NOSE FINS**
Investigation of aerodynamic characteristics of subsonic wings
[NASA-CR-158661] N79-23921
- NOZZLE DESIGN**
Partially variable area turbine nozzle
[AIAA PAPER 79-1227] A79-38992
- Static test of a large scale swivel nozzle thrust deflector
[AIAA PAPER 79-1285] A79-39020
- Evaluation of ground-launch firings for the improved 2.75-inch rocket
[AIAA PAPER 79-1297] A79-39027
- Aircraft engine nozzle
[NASA-CASE-ARC-10977-1] N79-23971
- NOZZLE FLOW**
Velocity slip and temperature difference of gas mixtures in quasi-one-dimensional nozzle flows
A79-36423
- Profiling of two-dimensional and three-dimensional nozzles and calculation of their flows
A79-38168
- NOZZLE GEOMETRY**
Profile of a nozzle shaping the free-molecule flow intended to investigate air-intakes and cascades
A79-36122
- A parametric study of support system interference effects on nozzle/afterbody throttle dependent drag in wind tunnel testing
[AIAA PAPER 79-1168] A79-38968
- Assessment at full scale of nozzle/wing geometry effects on OTW aeroacoustic characteristics --- Over The Wing STOL engine configurations
A79-39802
- Theoretical fan velocity distortions due to inlets and nozzles --- in V/STOL aircraft
[NASA-TM-79150] N79-23911
- Assessment at full scale of nozzle/wing geometry effects on OTW aero-acoustic characteristics --- short takeoff aircraft noise
[NASA-TM-79168] N79-25841
- NOZZLES**
Evaluation of methods for prediction of propulsion system drag
[AIAA PAPER 79-1148] A79-38961
- NUCLEAR EMULSIONS**
Observation of atmospheric interactions at aeroplane altitude --- gamma ray emulsion experiments
A79-37573
- NUCLEAR EXPLOSIONS**
NOVA-2S, a stiffened panel extension of the NOVA-2 computer program
[AD-A066038] N79-23951
- NUCLEONS**
Vertical cutoff rigidity and the intensity distribution of cosmic rays near Cape Town
A79-37468
- NUMERICAL CONTROL**
Digital flight control research using microprocessor technology
A79-38533
- Application of digital controls on the quiet clean short haul experimental engines
[AIAA PAPER 79-1203] A79-38984
- Multivariable control altitude demonstration on the F100 turbofan engine
[AIAA PAPER 79-1204] A79-39814
- Multifunction keyboard implementation study
[AD-A066140] N79-25046
- NUMERICAL FLOW VISUALIZATION**
Numerical calculation of inviscid transonic flow through rotors and fans
N79-23906

O

OMEGA NAVIGATION SYSTEM

- Internationalization of OMEGA
A79-36069
- The MX 1105, an integrated Transit/Omega navigator
A79-36072

ONBOARD EQUIPMENT

- A general aviation flight test application of the on-board computer
[SAE PAPER 790583] A79-36718
- Aerospace computer systems. Part 1: Avionics applications, volume 2. A bibliography with abstracts
[NTIS/PS-79/0312/3] N79-23959
- Aerospace computer systems. Part 1: Avionics applications, volume 3. A bibliography with abstracts
[NTIS/PS-79/0313/1] N79-23960

OPERATING TEMPERATURE

- Engine demonstration test of a cooled laminated axial turbine
[AIAA PAPER 79-1229] A79-38993

OPTICAL COMMUNICATION

- An optical-fiber multiterminal data system for aircraft
A79-36484
- Air Force Space Laser Communications
A79-38706

OPTICAL MEASUREMENT

- Making fluid flows visible
A79-36373

OPTIMAL CONTROL

- Active control for the Total-In-Flight simulator (ACTIFS)
[NASA-CR-3118] N79-23978
- Time optimal control of a jet engine using a quasi-Hermite interpolation model
[NASA-CR-158711] N79-25019
- Optimal placement of regional flight simulators
[AD-A060450] N79-25043

OPTIMIZATION

- Optimal selection of the geometrical characteristics of the reversing channel of a small-scale turbine with readmission of the gas --- for aircraft auxiliary power systems
A79-36583
- The design and selection of optimum propellers for general aviation aircraft
[SAE PAPER 790575] A79-36711
- Proper aircraft tire size selection - Optimum performance with minimum maintenance
[SAE PAPER 790598] A79-36730
- Minimization theory of induced drag subject to constraint conditions
[NASA-CR-3140] N79-23923
- Substructuring methods for design sensitivity analysis and structural optimization
[AD-A065935] N79-23949

ORIFICE FLOW

- Determination of cooling air mass flow for a horizontally-opposed aircraft engine installation
[SAE PAPER 790609] A79-36740

OSCILLATING CYLINDERS

- Vortex-induced oscillations - A selective review
A79-39751

OSCILLATING FLOW

- Theoretical analysis of transonic flow past unstaggered oscillating cascades
[AD-A063083] N79-24963

OSCILLATIONS

- An introduction to dynamic derivatives. 2: The equations of motion for wind tunnel pitch-yaw oscillation rigs
[ARL-AERO-NOTE-377] N79-23982

OUTLET FLOW

- Turbulence measurements in the compressor exit flow of a General Electric CP6-50 engine
N79-24996

OVERPRESSURE

- NOVA-2S, a stiffened panel extension of the NOVA-2 computer program
[AD-A066038] N79-23951

P

P-3 AIRCRAFT

- The operational impact of Navy's first TAAF program --- P-3C Test, Analyze and Fix
A79-39890

PANELS

- NOVA-2S, a stiffened panel extension of the NOVA-2 computer program
[AD-A066038] N79-23951

PARACHUTES

- Effects of a spin chute installation on spin characteristics --- of light general aviation aircraft
[SAE PAPER 790564] A79-36705

PARAMETERIZATION

- Life cycle cost analysis concepts and procedures
N79-25408

PARTICLE INTERACTIONS

- Observation of atmospheric interactions at aeroplane altitude --- gamma ray emulsion experiments
A79-37573

PASSENGER AIRCRAFT

- A European view on gas turbine engine monitoring of present and future civil aircraft
[AIAA PAPER 79-1200] A79-38982
- The airport performance model. Volume 1: Extensions, validations, and applications
[AD-A062863] N79-25040

PAVEMENTS

- Evaluation of materials for post-attack pavement repair
[AD-A066516] N79-25251

PERFORMANCE PREDICTION

- Evaluation of GPS performance for low-cost general aviation
A79-36065

- Reliability, performance, and fault isolation considerations in the design of interconnected navigation systems
A79-36077

- The design and selection of optimum propellers for general aviation aircraft
[SAE PAPER 790575] A79-36711

- The analysis of propellers including interaction effects --- for general aviation aircraft
[SAE PAPER 790576] A79-36712

- Selection of aircraft turbocharger systems
[SAE PAPER 790608] A79-36739

- General aviation aircraft design for performance using small computers
[SAE PAPER 790614] A79-36743

- Fossil fuel heat pumps for domestic, commercial and industrial space heating
A79-37852

- A tire runway interface friction prediction model concept
A79-38137

- The multiple application core engine - Sizing and usage criteria --- high-pressure rotors in jet engines
[AIAA PAPER 79-1123] A79-38953

- A novel correlation of centrifugal compressor performance for off-design prediction
[AIAA PAPER 79-1159] A79-38965

- Damage tolerant design - An approach to reducing the life cycle cost of gas turbine engine disks
[AIAA PAPER 79-1189] A79-38976

- Methodology for prediction of V/STOL propulsion induced forces in ground effect
[AIAA PAPER 79-1281] A79-39017

- What small turbine engine does the small helicopter need, or The road to hell is paved with good intentions --- fuel consumption, performance, environmental and engine reliability and acceptability considerations

- subordinating advanced turbine engine development for small helicopters
[AIAA PAPER 79-1314] A79-39032

- An improved method for predicting the effects of flight on jet mixing noise
A79-39803

- Regression Simulation of turbine engine performance: Accuracy improvement (task 4)
[AD-A066398] N79-25027

PERFORMANCE TESTS

- The impact of noise regulations on propeller design
[SAE PAPER 790593] A79-36727

- Determination of cooling air mass flow for a horizontally-opposed aircraft engine installation
[SAE PAPER 790609] A79-36740

- A canister fuel pump for general aviation aircraft
[SAE PAPER 790624] A79-36752

- An experimental study of propeller-induced structural vibration and interior noise
[SAE PAPER 790625] A79-36753

PERSONNEL DEVELOPMENT

SUBJECT INDEX

- Wind tunnel performance of four energy efficient
propellers designed for Mach 0.8 cruise
[SAE PAPER 790573] A79-36759

Combined pressure and temperature distortion effects on internal flow of a turbofan engine [AIAA PAPER 79-1309]

A79-39031

Predicted F100 engine response to circumferential pressure and temperature distortion [AIAA PAPER 79-1310]

A79-39819

Effect of steady-state pressure distortion on flow characteristics entering a turbofan engine [NASA-TM-79134]

N79-23969

PRESSURE GAGES

Feasibility and cost effectiveness of airborne tire pressure indicating systems [AD-A065513]

N79-24981

PRESSURE OSCILLATIONS

Effects of steady-state pressure distortion on the stall margin of a J85-21 turbojet engine [NASA-TM-79123]

N79-23968

PRESSURE SENSORS

Conversion of wing surface pressures into normalized lift coefficient [SAE PAPER 790567]

A79-36707

PRESSURIZED CABINS

Adhesive bonded structure of new pressurized piston twin aircraft [SAE PAPER 790563]

A79-36704

PRIMERS (COATINGS)

Evaluation of new bonding systems for depot-level maintenance of aircraft honeycomb panels [AD-A066117]

N79-24161

PROBABILITY DENSITY FUNCTIONS

Application of advanced data reduction methods to gas turbine dynamic analysis

A79-36024

PRODUCT DEVELOPMENT

The Rockwell International Sabreliner-65: Case study in aircraft design --- Book

A79-36645

Development of the Beechcraft Model 77 [SAE PAPER 790617]

A79-36745

General aviation turbine engine /GATE/ concepts [AIAA PAPER 79-1157]

A79-38964

Turbo-fan design for general aviation - The evolution of the RB.401 [AIAA PAPER 79-1160]

A79-38966

PRODUCTION ENGINEERING

Development of the Beechcraft Model 77 [SAE PAPER 790617]

A79-36745

Computer graphics create the new wave of design

A79-37046

Some main points about general-aviation design practice

A79-37047

Design, meet production --- aircraft cost and performance tradeoff considerations

A79-37048

Life cycle cost analysis concepts and procedures

N79-25408

PROGRAM TREND LINE ANALYSIS

A review of the icing situation from the standpoint of general aviation

N79-23918

PROGRAM VERIFICATION (COMPUTERS)

Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics [SAE PAPER 790589]

A79-36723

Validation of aircraft noise prediction program [NASA-CR-159047]

N79-25843

PROGRAMMING LANGUAGES

Exploring team avionics systems by simulation

A79-38882

PROJECT MANAGEMENT

The operational impact of Navy's first TAAF program --- P-3C Test, Analyze and Fix

A79-39890

PROJECT PLANNING

Is the AV-8B Advanced Harrier aircraft ready for full-scale development [PB-290826/7]

N79-24987

PROPELLER BLADES

The design and selection of optimum propellers for general aviation aircraft [SAE PAPER 790575]

A79-36711

The analysis of propellers including interaction effects --- for general aviation aircraft [SAE PAPER 790576]

A79-36712

Development of an aircraft composite propeller [SAE PAPER 790579]

A79-36714

Practical design of minimum induced loss propellers [SAE PAPER 790585]

A79-36720

The impact of noise regulations on propeller design [SAE PAPER 790593]

A79-36727

An experimental study of propeller-induced structural vibration and interior noise [SAE PAPER 790625]

A79-36753

Tone noise of three supersonic helical tip speed propellers in a wind tunnel

A79-39801

Interference effects of aircraft components on the local blade angle of attack of a wing-mounted propeller [NASA-TM-78587]

N79-25021

Tone noise of three supersonic helical tip speed propellers in a wind tunnel [NASA-TM-79167]

N79-25840

PROPELLER DRIVE

Experimental data on the dynamic properties of several propeller vanes --- turbulence measurement in wind tunnel

A79-38943

PROPELLER EFFICIENCY

The design and selection of optimum propellers for general aviation aircraft [SAE PAPER 790575]

A79-36711

Practical design of minimum induced loss propellers [SAE PAPER 790585]

A79-36720

Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise [SAE PAPER 790573]

A79-36759

The application of the Prop-Fan concept in preliminary design of a very advanced technology light twin /VATLIT '85/ [AIAA PAPER 79-1343]

A79-39047

PROPELLER FANS

The application of the Prop-Fan concept in preliminary design of a very advanced technology light twin /VATLIT '85/ [AIAA PAPER 79-1343]

A79-39047

Design study and performance analysis of a high-speed multistage variable-geometry fan for a variable cycle engine [NASA-CR-159545]

N79-25020

PROPELLERS

Design of quiet efficient propellers [SAE PAPER 790584]

A79-36719

Design of propellers for motorsoarers

N79-23903

Simulated propeller slipstream effects on a supercritical wing [NASA-CR-152138]

N79-25024

PROPULSION

Advanced General Aviation Turbine Engine (GATE) concepts [NASA-CR-159603]

N79-25017

PROPULSION SYSTEM CONFIGURATIONS

The impact of operational requirements on V/STOL propulsion concept selection [AIAA PAPER 79-1283]

A79-39018

PROPULSION SYSTEM PERFORMANCE

- The design and selection of optimum propellers for general aviation aircraft
[SAE PAPER 790575] A79-36711
- Propulsion system sensitivities for a strategic aircraft
[AIAA PAPER 79-1121] A79-38952
- A European view on gas turbine engine monitoring of present and future civil aircraft
[AIAA PAPER 79-1200] A79-38982
- Design study and performance analysis of a high-speed multistage variable-geometry fan for a variable cycle engine
[NASA-CR-159545] N79-25020
- PSYCHOPHYSIOLOGY**
Motion in flight simulation: An annotated bibliography
[AD-A061687] N79-25042
- PULSED LASERS**
Small hole drilling and inspection with pulsed laser systems --- in air-cooled aircraft engine structures
[AIAA PAPER 79-1268] A79-39012

Q

QUADRATIC PROGRAMMING

- A computer program for double sweep optimal smoothing
[AD-A066512] N79-25278

QUIET ENGINE PROGRAM

- Preliminary QCGAT program test results --- Quiet, Clean General Aviation Turbofan
[SAE PAPER 790596] A79-36729

R

RADAR BEACONS

- Discrete address beacon system. A bibliography with abstracts
[NTIS/PS-79/0244/8] N79-23945

RADAR DETECTION

- The intercept of covert radar
A79-38132
- A family of air traffic control radars
A79-38532

RADAR EQUIPMENT

- CERT technology applied to an airborne radar --- Combined Environment Reliability Testing
A79-39893

RADAR RANGE

- A family of air traffic control radars
A79-38532

RADAR TARGETS

- A family of air traffic control radars
A79-38532

RADAR TRACKING

- A computer program for double sweep optimal smoothing
[AD-A066512] N79-25278

RADIAL DISTRIBUTION

- Radial equilibrium in axial turbomachines
A79-37828

RADIANT FLUX DENSITY

- Vertical cutoff rigidity and the intensity distribution of cosmic rays near Cape Town
A79-37468

RADIATIVE HEAT TRANSFER

- Transient ablation of Teflon in intense radiative and convective environments
A79-38123

RADIO ALTIMETERS

- Theoretical fundamentals of radio altimetry --- Russian book
A79-38145

RADIO NAVIGATION

- Internationalization of OMEGA
A79-36069

RADIO TELEMETRY

- Some possible applications of identification theory techniques in telemetry --- for aircraft communication
A79-36589

RADIO TRANSMITTERS

- Evaluation of an FM/CW range measurement system for VTOL landing
A79-36086

RADIOGRAPHY

- High resolution radiography in the aero-engine industry
N79-25414

RANGE ERRORS

- Hyperbolic positioning per se is passe --- navigation computations from range measurements using microprocessor
A79-36070

RANGE FINDERS

- Evaluation of an FM/CW range measurement system for VTOL landing
A79-36086

RANGEFINDING

- Stability analysis of relative navigation systems --- TDMA system for multi-member aircraft communities
A79-36090

REDUNDANT COMPONENTS

- Electronic system safety - Testing reality --- for avionics
[SAE PAPER 790570] A79-36710

REFRACTORY METAL ALLOYS

- The strainrange partitioning behavior of an advanced gas turbine disk alloy, AF2-1DA
[AIAA PAPER 79-1192] A79-38977

REGRESSION ANALYSIS

- Regression Simulation of turbine engine performance: Accuracy improvement (task 4)
[AD-A066398] N79-25027
- Recent experience in the development and application of LCC models
N79-25410

REINFORCED PLASTICS

- Composite applications at Bell Helicopter
[SAE PAPER 790578] A79-36713

RELIABILITY

- RTCA standards - Improved specs. and regulations --- in avionics equipment
A79-39919

RELIABILITY ANALYSIS

- CERT technology applied to an airborne radar --- Combined Environment Reliability Testing
A79-39893
- RELSIN-A systems reliability simulation code
A79-39900
- Lower avionics temperature - Lower life cycle cost
A79-39914
- Reliability and maintainability contribution to Boraet mission success
A79-39915
- The effect of endless burn-in on reliability growth projections --- for solid state aviation electronics equipment
A79-39920

RELIABILITY ENGINEERING

- Reliability, performance, and fault isolation considerations in the design of interconnected navigation systems
A79-36077
- Changing requirements in aircraft design
A79-37044
- Fault-tolerant, high reliability electronic engine control system
[AIAA PAPER 79-1202] A79-38983
- The F-16 RIW program --- Reliability Improvement Warranty
A79-39889
- The operational impact of Navy's first TAAF program --- P-3C Test, Analyze and Fix
A79-39890

REMOTE CONTROL

- Drone formation control system /DFCS/ - A new generation test range system
A79-36084

REMOTELY PILOTED VEHICLES

- Drone formation control system /DFCS/ - A new generation test range system
A79-36084

RESEARCH AIRCRAFT

- A unique facility for V/STOL aircraft hover testing
A79-37296
- Aeroelastic stability analysis of the AD-1 manned oblique-wing aircraft
A79-38136
- Digital flight control research using microprocessor technology
A79-38533

RESEARCH AND DEVELOPMENT

- A review of Curtiss-Wright rotary engine developments with respect to general aviation potential
[SAE PAPER 790621] A79-36749
- Research and development activities in Italy in the field of aerospace structures and materials
[AGARD-R-675] N79-24202

RESIDUAL STRESS

- X-ray determination of internal stress states due to surface treatment of TiAl6V4 and TiAl6V6Sn2
A79-36003

RESISTANCE HEATING

- Aircon electrically heated acrylic --- for ice formation prevention on aircraft transparencies
[SAE PAPER 790600] A79-36732

ROCKET FIRING

- Evaluation of ground-launch firings for the improved 2.75-inch rocket
[AIAA PAPER 79-1297] A79-39027

ROCKET NOZZLES

- Evaluation of ground-launch firings for the improved 2.75-inch rocket
[AIAA PAPER 79-1297] A79-39027

ROLLING MOMENTS

- Some observations on the mechanism of aircraft wing rock
A79-38135

ROTARY WING AIRCRAFT

- Advanced rotorcraft technology: Task force report
[NASA-TM-80541] N79-24951

ROTARY WINGS

- Rotor blade stability in turbulent flows. I
A79-38118

- An investigation of a full-scale rotor with four blade tip planform shapes --- in Ames Research Center 40 by 80 Foot Wind Tunnel
[NASA-TM-78580] N79-23922

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 6B: One-third octave band spectrograms of wake single film data, basic configuration wake explorations
[AD-A061861] N79-23931

- A simplified rotor system mathematical model for piloted flight dynamics simulation
[NASA-TM-78575] N79-23977

- Helicopter rotor airfoil
[NASA-CASE-LAR-12396-1] N79-24958

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 3B: Flow angle and velocity wake profiles in low frequency band, air ejector systems and other devices
[AD-A061767] N79-24966

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 2B: Harmonic analysis of airframe surface pressure data, runs 7-14, mid section
[AD-A061860] N79-24967

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 6B: One-third octave band spectrograms of wake single film data, basic configuration wake explorations
[AD-A061861] N79-24968

- Aeroelastically conformable rotor mission analysis
[AD-A067338] N79-24985

- An experimental investigation of the effect of rotor tip shape on helicopter blade-slap noise --- in the Langley v/stol wind tunnel
[NASA-TM-80066] N79-25844

ROTOR AERODYNAMICS

- Experimental analysis methods for unsteady flows in turbomachines
[ONERA, TP NO. 1979-59] A79-39095

- An investigation of a full-scale rotor with four blade tip planform shapes --- in Ames Research Center 40 by 80 Foot Wind Tunnel
[NASA-TM-78580] N79-23922

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 6B: One-third octave band spectrograms of wake single film data, basic configuration wake explorations
[AD-A061861] N79-23931

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 3A: Flow angle and velocity wake profiles in low frequency band, basic investigations and hub variations
[AD-A061766] N79-23932

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 3B: Flow angle and velocity wake profiles in low frequency band, air ejector systems and other devices
[AD-A061767] N79-23933

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 2B: Harmonic analyses of airframe surface pressure data, runs 7 - 14, midsection
[AD-A061860] N79-23934

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 3B: Flow angle and velocity wake profiles in low frequency band, air ejector systems and other devices
[AD-A061767] N79-24966

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 2B: Harmonic analysis of airframe surface pressure data, runs 7-14, mid section
[AD-A061860] N79-24967

- Interactional aerodynamics of the single rotor helicopter configuration. Volume 6B: One-third octave band spectrograms of wake single film data, basic configuration wake explorations
[AD-A061861] N79-24968

- An experimental investigation of the effect of rotor tip shape on helicopter blade-slap noise --- in the Langley v/stol wind tunnel
[NASA-TM-80066] N79-25844

ROTOR BLADES (TURBOCHINERY)

- Helicopter rotor airfoil
[NASA-CASE-LAR-12396-1] N79-24958

ROTORS

- The multiple application core engine - Sizing and usage criteria --- high-pressure rotors in jet engines
[AIAA PAPER 79-1123] A79-38953

- The monorotor gas turbine
[AIAA PAPER 79-1230] A79-38994

- Numerical calculation of inviscid transonic flow through rotors and fans
N79-23906

RUNWAY CONDITIONS

- A tire runway interface friction prediction model concept
A79-38137

RUNWAYS

- Evaluation of materials for post-attack pavement repair
[AD-A066516] N79-25251
- Ground winds for Kennedy Space Center, Florida, 1979 revision
[NASA-TM-78229] N79-25662

S

S-N DIAGRAMS

- The strainrange partitioning behavior of an advanced gas turbine disk alloy, AP2-1DA
[AIAA PAPER 79-1192] A79-38977

S-3 AIRCRAFT

- Analysis of the impact of a 270 VDC power source on the avionic power supplies in the S-3A aircraft
[AD-A066526] N79-24989

SAILWINGS

- A comparison of the aerodynamic characteristics of eight sailing airfoil sections
N79-23897

SATELLITE NAVIGATION SYSTEMS

- Satellite interferometer as an advanced navigation/communication system
A79-39602

SATELLITE-BORNE INSTRUMENTS

- Satellite interferometer as an advanced navigation/communication system
A79-39602

SCALE MODELS

- Model diffuser investigation for propulsion wind tunnel 16T
[AD-A065822] N79-23984

SEALERS

- Dynamic evaluation of experimental integral fuel-tank sealants, part 2
[AD-A066592] N79-25236

SEATS

Seat/occupant crash dynamic analysis verification
test program
[SAE PAPER 790590] A79-36724
NASA general aviation crashworthiness seat
development
[SAE PAPER 790591] A79-36725
SERVICE LIFE
Effects of extended oil changes on aircraft piston
engine wear and oil characteristics
[SAE PAPER 790629] A79-36756
Changing requirements in aircraft design
A79-37044

SHIPS

VOLAR: A digital computer program for simulating
VSTOL aircraft launch and recovery from small
ships. Volume 1: Program description
[AD-A066172] N79-23954
VOLAR: A digital computer program for simulating
VSTOL aircraft launch and recover from small
ships. Volume 2: Appendices
[AD-A066173] N79-23955

SHOCK TESTS

Effect of shocks on film cooling of a full scale
turbojet exhaust nozzle having an external
expansion surface
[NASA-TM-79157] N79-23966

SHOCK WAVE PROPAGATION

Thermospheric propagation of sonic booms from the
Concorde supersonic transport
[AD-A067201] N79-25855

SHOCK WAVES

Effect of shocks on film cooling of a full scale
turbojet exhaust nozzle having an external
expansion surface
[AIAA PAPER 79-1170] A79-38969
Status of knowledge of sonic booms
[NASA-TM-80113] N79-24955

SHORT HAUL AIRCRAFT

Boeing 757/767 - On-the-spot report
A79-36374
Application of digital controls on the quiet clean
short haul experimental engines
[AIAA PAPER 79-1203] A79-38984

SHORT TAKEOFF AIRCRAFT

Calculation of a laminar wall jet in a wake
A79-36582
Assessment at full scale of nozzle/wing geometry
effects on OTW aeroacoustic characteristics ---
Over The Wing STOL engine configurations
A79-39802
Assessment at full scale of nozzle/wing geometry
effects on OTW aero-acoustic characteristics ---
short takeoff aircraft noise
[NASA-TM-79168] N79-25841

SIGNAL PROCESSING

Recent results in navigation systems utilizing
signal aiding from Navstar satellites
A79-36096

SIGNATURE ANALYSIS

Infrared signature measurement techniques and
simulation methods for aircraft survivability
[AIAA PAPER 79-1186] A79-38975

SILICON CARBIDES

Brittle materials design, high temperature gas
turbine: Ceramic turbine rotor technology
[AD-A067176] N79-25029

SILICON NITRIDES

Brittle materials design, high temperature gas
turbine: Ceramic turbine rotor technology
[AD-A067176] N79-25029

SIMILARITY THEOREM

Aeroelastic models for cryogenic wind tunnels
[ONERA, TP NO. 1979-39] A79-39088

SIMULATORS

Evaluation of an ejector-powered engine simulator
at transonic Mach numbers
[AIAA PAPER 79-1165] A79-38967

SINGLE CRYSTALS

Directionally solidified blades - Greater strength
A79-36248

SITTING POSITION

Seat/occupant crash dynamic analysis verification
test program
[SAE PAPER 790590] A79-36724

SIZE DETERMINATION

Proper aircraft tire size selection - Optimum
performance with minimum maintenance
[SAE PAPER 790598] A79-36730

The multiple application core engine - Sizing and
usage criteria --- high-pressure rotors in jet
engines
[AIAA PAPER 79-1123] A79-38953

SKIW (STRUCTURAL MEMBER)

Adhesive bonded structure of new pressurized
piston twin aircraft
[SAE PAPER 790563] A79-36704

SLENDER CONES

Measurement of the drag of slender cones in
hypersonic flow at low Reynolds numbers using a
magnetic suspension and balance
[OUEL-1235/78] N79-23938

SLIPSTREAMS

Calculation of a laminar wall jet in a wake
A79-36582

Simulated propeller slipstream effects on a
supercritical wing
[NASA-CR-152138] N79-25024

SLOT ANTENNAS

An iterative approach for computing an antenna
aperture distribution from given radiation
pattern data
[AD-A065590] N79-24217

SOARING

The science and technology of low speed and
motorless flight, part 1
[NASA-CR-2085] N79-23889
Design of propellers for motorsoarers
N79-23903

SOLAR ELECTRIC PROPULSION

Project Sunrise --- solar-powered aircraft flight
demonstration
[AIAA PAPER 79-1264] A79-39010

SOLAR ENERGY CONVERSION

Photovoltaics and environmental impact
considerations
N79-25496

SOLID STATE DEVICES

The effect of endless burn-in on reliability
growth projections --- for solid state aviation
electronics equipment
A79-39920

SOLID STATE LASERS

Small hole drilling and inspection with pulsed
laser systems --- in air-cooled aircraft engine
structures
[AIAA PAPER 79-1268] A79-39012

SOLID-SOLID INTERFACES

Fretting fatigue, with reference to aircraft
structures
[SAE PAPER 790612] A79-36741
A tire runway interface friction prediction model
concept
A79-38137

SOLIDIFICATION

The application of rapid solidification rate
superalloys to radial wafer turbine blades
[AIAA PAPER 79-1226] A79-38991

SONIC BOOMS

Aircraft sonic boom: Effects on buildings. A
bibliography with abstracts
[NTIS/PS-79/0265/3] N79-24201
Aircraft sonic boom: Studies on aircraft flight,
aircraft design, and measurement. A
bibliography with abstracts
[NTIS/PS-79/0264/6] N79-24780
Status of knowledge of sonic booms
[NASA-TM-80113] N79-24955
Thermospheric propagation of sonic booms from the
Concorde supersonic transport
[AD-A067201] N79-25855

SPACECRAFT COMMUNICATION

Satellite interferometer as an advanced
navigation/communication system
A79-39602

SPARK IGNITION

The effect of hydrogen addition on ignition delays
and flame propagation in spark ignition engines
A79-38387

SPECTROGRAMS

Interactional aerodynamics of the single rotor
helicopter configuration. Volume 68: One-third
octave band spectrograms of wake single film
data, basic configuration wake explorations
[AD-A061861] N79-23931

SPECTRUM ANALYSIS

Application of advanced data reduction methods to
gas turbine dynamic analysis A79-36024

SPEED CONTROL

Sidestick/Throttle Controller - An alternate
approach A79-38476

SPEED INDICATORS

Theoretical fundamentals of radio altimetry ---
Russian book A79-38145

SPIN STABILIZATION

Spin flight research summary
[SAE PAPER 790565] A79-36706

SPIN TESTS

Effects of a spin chute installation on spin
characteristics --- of light general aviation
aircraft
[SAE PAPER 790564] A79-36705

SPOILERS

Some theoretical considerations of a stall proof
airplane
[SAE PAPER 790604] A79-36736

STANDARDIZATION

Avionics standardization potential analysis
[AD-A066138] N79-23958

STANDARDS

RTCA standards - Improved specs. and regulations
--- in avionics equipment A79-39919

STATIC PRESSURE

Conversion of wing surface pressures into
normalized lift coefficient
[SAE PAPER 790567] A79-36707
Effect of steady-state pressure distortion on flow
characteristics entering a turbofan engine
[NASA-TN-79134] N79-23969

STATIC STABILITY

Control considerations for CCV fighters at high
angles of attack A79-37295

STATIC TESTS

Static test of a large scale swivel nozzle thrust
deflector
[AIAA PAPER 79-1285] A79-39020

STATISTICAL ANALYSIS

Safety hazard of aircraft icing
N79-23916

Statistical comparisons of aircraft flyover noise
adjustment procedures for different weather
conditions
[NASA-TP-1430] N79-24773

Forecasting the quantitative characteristics of
aircraft icing
[BLL-TRANS-1364-(9022.549)] N79-24971

STATORS

The monorotor gas turbine
[AIAA PAPER 79-1230] A79-38994

STIFFNESS MATRIX

NOVA-2S, a stiffened panel extension of the NOVA-2
computer program
[AD-A066038] N79-23951

STOCHASTIC PROCESSES

Rotor blade stability in turbulent flows. I
A79-38118

STORAGE STABILITY

Stability characteristics of hydrocarbon fuels
from alternative sources
[BETC/RI-78/23] N79-24178

STRESS ANALYSIS

The strainrange partitioning behavior of an
advanced gas turbine disk alloy, AF2-1DA
[AIAA PAPER 79-1192] A79-38977
Aircraft engine design using experimental stress
analysis techniques
[AIAA PAPER 79-1193] A79-38978

STRESS-STRAIN DIAGRAMS

A variational theorem for laminated composite
plates of nonlinear materials and applications
to postbuckling N79-24977

STRESS-STRAIN RELATIONSHIPS

Cost benefits from improved hot section life
prediction technology --- for aircraft engine
combustor and turbine parts
[AIAA PAPER 79-1154] A79-38963

STRUCTURAL ANALYSIS

Aircraft engine design using experimental stress
analysis techniques
[AIAA PAPER 79-1193] A79-38978
Partially variable area turbine nozzle
[AIAA PAPER 79-1227] A79-38992
Low-speed single-element airfoil synthesis
N79-23890

Some new airfoils
N79-23896

ANALYZE: Analysis of aerospace structures with
membrane elements
[AD-A065633] N79-24379
Aeroelastically conformable rotor mission analysis
[AD-A067338] N79-24985
User's guide: Computer program with interactive
graphics for analysis of plane frame structures
(CFRAME)
[AD-A067349] N79-25428

STRUCTURAL DESIGN

Design description of a four-place business jet
using two WR-19 engines
[SAE PAPER 790580] A79-36715
A starter for gas turbine engines
A79-36797

The role of three-dimensional flow analysis in the
design of turbomachinery
[AIAA PAPER 79-1231] A79-38995

Low-speed single-element airfoil synthesis
N79-23890

Optimum tail plane design for sailplanes
N79-23892

Introduction to the arcopter arc wing and the
Bertelsen effect for positive pitch stability
and control N79-23895

Some new airfoils
N79-23896

Design of propellers for motorsoarers
N79-23903

Substructuring methods for design sensitivity
analysis and structural optimization
[AD-A065935] N79-23949

Fail-safe optimal design of structures with
substructuring
[AD-A065936] N79-23950

The application of structured design and
distributed techniques to avionics information
processing architectures N79-25991

STRUCTURAL DESIGN CRITERIA

Experimental verification of program KRASH - A
mathematical model for general aviation
structural crash dynamics
[SAE PAPER 790589] A79-36723

Damage tolerant design - An approach to reducing
the life cycle cost of gas turbine engine disks
[AIAA PAPER 79-1189] A79-38976

STRUCTURAL ENGINEERING

Dynamic structural analysis with substructures
[AD-A065937] N79-24378

STRUCTURAL RELIABILITY

Aircraft design and strength /2nd revised and
enlarged edition/ --- Russian book A79-38140

Structural properties of adhesives, volume 1
[AD-A065500] N79-24155

STRUCTURAL STABILITY

Aeroelastic stability analysis of the AD-1 manned
oblique-wing aircraft A79-38136

STRUCTURAL VIBRATION

Model verification of force determination for
measuring vibratory loads --- of rotors on
helicopters A79-36379

An experimental study of propeller-induced
structural vibration and interior noise
[SAE PAPER 790625] A79-36753

Designing with damping materials to reduce noise
and structural fatigue --- of aircraft components
[SAE PAPER 790631] A79-36758

STRUCTURAL WEIGHT

The evaluation of the weight of engine
installations on transport aircraft A79-37827

SUBSONIC AIRCRAFT

SUBJECT INDEX

SUBSONIC AIRCRAFT

Advanced low emissions catalytic combustor program
at Pratt and Whitney

N79-25012

SUBSONIC FLOW

Numerical optimization techniques for bound
circulation distribution for minimum induced
drag of nonplanar wings: Basic formulations
[NASA-CR-3154]

N79-23924

SUBSONIC SPEED

Self stabilizing sonic inlet
[NASA-CASE-LEW-11890-1]

N79-24976

SUBSTITUTES

The impact of alternate fuels on aircraft
configuration characteristics --- military
aircraft
[AD-A066983]

N79-25244

SUBSTRUCTURES

Substructuring methods for design sensitivity
analysis and structural optimization
[AD-A065935]

N79-23949

SUPERCHARGERS

Effects of air injection on a turbocharged
Teledyne Continental Motors TSI0-360-C engine
[SAE PAPER 790607]
Two-stage supercharger sets: Efficiency and head
distribution under full- and part-load conditions
[RTS-11613]

N79-24342

SUPERCritical WINGS

Simulated propeller slipstream effects on a
supercritical wing
[NASA-CR-152138]

N79-25024

SUPERHIGH FREQUENCIES

Evaluation of an FM/CW range measurement system
for VTOL landing

A79-36086

SUPERSONIC COMBUSTION

Ignition of liquid fuel jets in a supersonic air
stream
[AIAA PAPER 79-1238]

A79-38997

SUPERSONIC COMBUSTION RAMJET ENGINES

Autoignition of hydrogen injected transverse to a
supersonic airstream
[AIAA PAPER 79-1239]

A79-39818

SUPERSONIC FLOW

Theory of thin wing in a supersonic flow with
consideration of the non-equilibrium state of
excitation of oscillating degrees of freedom
[AD-A065992]

N79-23928

Supersonic flow in the area of antisymmetric thin
cruciform wings with supersonic leading edges in
a horizontal plane, with consideration of flow
separation on the edges
[AD-A065993]

N79-23929

SUPERSONIC SPEEDS

Tone noise of three supersonic helical tip speed
propellers in a wind tunnel
[NASA-TM-79167]

N79-25840

SUPERSONIC TRANSPORTS

Characteristics of the advanced supersonic
technology AST-105-1 configured for transpacific
range with Pratt and Whitney aircraft variable
stream control engines
[NASA-TM-78818]

N79-23888

SUPERSONIC TURBINES

Rolls-Royce RB.401-07 turbofan engine for business
aircraft in the 1980's
[SAE PAPER 790620]

A79-36748

SUPPORTS

Balance and sting design for cryogenic wind tunnels
[ONERA, TP NO. 1979-40]

A79-39089

SURFACE FINISHING

X-ray determination of internal stress states due
to surface treatment of TiAl6V4 and TiAl6V6Sn2

A79-36003

SURFACE NAVIGATION

Internationalization of OMEGA

A79-36069

SURFACE ROUGHNESS

The effect of disturbance on a wing

N79-23893

SURFACES

Construction of an initial approximation for the
solution of the integral equation of a lifting
surface

A79-35928

SWIRLING

Test verification of a turbofan partial swirl
afterburner
[AIAA PAPER 79-1199]

A79-38981

SWIVELS

Static test of a large scale swivel nozzle thrust
deflector
[AIAA PAPER 79-1285]

A79-39020

SYNCHRONOUS SATELLITES

Satellite interferometer as an advanced
navigation/communication system

A79-39602

SYSTEMS ANALYSIS

Drone formation control system /DFCS/ - A new
generation test range system

A79-36084

SYSTEMS ENGINEERING

Reliability, performance, and fault isolation
considerations in the design of interconnected
navigation systems

A79-36077

A Demonstration Advanced Avionics System for
general aviation
[SAE PAPER 790569]

A79-36709

A family of air traffic control radars

A79-38532

Active control for the Total-In-Flight simulator
(ACTIFS)
[NASA-CR-3118]

N79-23978

SYSTEMS STABILITY

Stability analysis of relative navigation systems
--- TDNA system for multi-member aircraft
communities

A79-36090

T

T-39 AIRCRAFT

The Rockwell International Sabreliner-65: Case
study in aircraft design --- Book

A79-36645

TACAN

A navigation filter for an integrated
GPS/JTIDS/INS system for a tactical aircraft ---
Joint Tactical Information Distribution System

A79-36087

TACHISTOSCOPES

Tachystoscopic testing of onboard instruments

A79-38817

TAIL ASSEMBLIES

Fail-safe optimal design of structures with
substructuring
[AD-A065936]

N79-23950

TARGET ACQUISITION

Night/Adverse Weather A-10 evaluator program

A79-38479

TARGET RECOGNITION

Optimum frequencies for aircraft classification
[AD-A065697]

N79-24220

TECHNOLOGICAL FORECASTING

Rolls-Royce RB.401-07 turbofan engine for business
aircraft in the 1980's
[SAE PAPER 790620]
Impact of advanced technologies on aircraft design

A79-37045

TECHNOLOGY ASSESSMENT

New opportunities for future small civil turbine
engines - Overviews the GATE studies
[SAE PAPER 790619]

A79-36747

Propulsion system sensitivities for a strategic
aircraft
[AIAA PAPER 79-1121]

A79-38952

The science and technology of low speed and
motorless flight, part 1
[NASA-CP-2085]

N79-23889

Overview of helicopter ice protection system
developments

N79-23919

Premixed Prevaporized Combustor Technology Forum
[NASA-CP-2078]

N79-24994

Advanced low emissions catalytic combustor program
at Pratt and Whitney

N79-25012

Non-destructive methods for the early detection of
fatigue damage in aircraft components

N79-25417

TECHNOLOGY UTILIZATION

New technologies for general aviation aircraft
[SAE PAPER 790613]

A79-36742

SUBJECT INDEX

TRAINING SIMULATORS

- Dry friction in the aerospace industry A79-39873
- Research and development activities in Italy in the field of aerospace structures and materials [AGARD-R-675] N79-24202
- Advanced low emissions catalytic combustor program at General Electric N79-25011
- Recent experience in the development and application of LCC models N79-25410
- TEFLOW (TRADEMARK)**
Transient ablation of Teflon in intense radiative and convective environments A79-38123
- TEMPERATURE EFFECTS**
Combined pressure and temperature distortion effects on internal flow of a turbofan engine [AIAA PAPER 79-1309] A79-39031
Predicted F100 engine response to circumferential pressure and temperature distortion [AIAA PAPER 79-1310] A79-39819
- TEMPERATURE INVERSIONS**
Combined pressure and temperature distortion effects on internal flow of a turbofan engine [NASA-TM-79136] N79-23963
- TEMPERATURE MEASUREMENT**
Inflight fuel tank temperature survey data [NASA-CR-159569] N79-23940
- TERMINAL CONFIGURED VEHICLE PROGRAM**
Capturing and tracking performance of the horizontal guidance and control systems of the terminal configured vehicle [NASA-TM-80068] N79-25034
- TEST EQUIPMENT**
Survivability in aircraft fires - New standards are needed A79-38091
Some observations on the mechanism of aircraft wing rock A79-38135
Evaluation of an ejector-powered engine simulator at transonic Mach numbers [AIAA PAPER 79-1165] A79-38967
- TEST FACILITIES**
A unique facility for V/STOL aircraft hover testing A79-37296
A streamlined control system development process --- to optimize aircraft propulsion system performance [AIAA PAPER 79-1344] A79-39048
Dynamic evaluation of experimental integral fuel-tank sealants, part 2 [AD-A066592] N79-25236
Ground winds for Kennedy Space Center, Florida, 1979 revision [NASA-TM-78229] N79-25662
- TEST PILOTS**
The test pilot in the airline industry or 'My bags are packed and I'm ready to go' A79-38478
- TEST RANGES**
Drone formation control system /DFCS/ - A new generation test range system A79-36084
- TEXTBOOKS**
Aerodynamics [NASA-TT-P-765] N79-23908
- TF-30 ENGINE**
Combined pressure and temperature distortion effects on internal flow of a turbofan engine [AIAA PAPER 79-1309] A79-39031
- THERMAL CONTROL COATINGS**
Industry tests of NASA ceramic thermal barrier coating --- for gas turbine engine applications [NASA-TP-1425] N79-25023
- THERMOSPHERE**
Thermospheric propagation of sonic booms from the Concorde supersonic transport [AD-A067201] N79-25855
- THIN WINGS**
Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927
Theory of thin wing in a supersonic flow with consideration of the non-equilibrium state of excitation of oscillating degrees of freedom [AD-A065992] N79-23928
- Supersonic flow in the area of antisymmetric thin cruciform wings with supersonic leading edges in a horizontal plane, with consideration of flow separation on the edges [AD-A065993] N79-23929
- THREE DIMENSIONAL BOUNDARY LAYER**
A method for the calculation of 3D boundary layers on practical wing configurations A79-38906
- THREE DIMENSIONAL FLOW**
Profiling of two-dimensional and three-dimensional nozzles and calculation of their flows A79-38168
Development of a gas turbine combustor dilution zone design analysis [AIAA PAPER 79-1194] A79-38979
The role of three-dimensional flow analysis in the design of turbomachinery [AIAA PAPER 79-1231] A79-38995
- THROTTLING**
Sidestick/Throttle Controller - An alternate approach A79-38476
- THRUST**
Energy maneuverability display validation --- F-16 aircraft [AFDRL-TR-78-35-VOL-1] N79-23947
- THRUST MEASUREMENT**
Recent results obtained with a new method for measuring aircraft power and drag in flight [SAE PAPER 790616] A79-36744
- THRUST VECTOR CONTROL**
Static test of a large scale swivel nozzle thrust deflector [AIAA PAPER 79-1285] A79-39020
- THRUST-WEIGHT RATIO**
A wind shear/downdraft drift angle warning system A79-38477
- TIME DIVISION MULTIPLE ACCESS**
Stability analysis of relative navigation systems --- TDMA system for multi-member aircraft communities A79-36090
- TIME DIVISION MULTIPLEXING**
An optical-fiber multiterminal data system for aircraft A79-36484
- TIME OPTIMAL CONTROL**
The time budget as a criterion for the workload of air traffic controllers [NBS-UPF-1353-0] N79-23943
- TIME SHARING**
Turbine design system [AD-A066092] N79-23974
- TIP SPEED**
The impact of noise regulations on propeller design [SAE PAPER 790593] A79-36727
Tone noise of three supersonic helical tip speed propellers in a wind tunnel A79-39801
- TITANIUM ALLOYS**
X-ray determination of internal stress states due to surface treatment of TiAl6V4 and TiAl6V6Sn2 A79-36003
Advanced forging process for gas turbine engine fan blades [AIAA PAPER 79-1269] A79-39013
- TORSIONAL VIBRATION**
Rotor blade stability in turbulent flows. I A79-38118
- TRACKING (POSITION)**
Precision controllability of the F-15 airplane [NASA-TM-72861] N79-23979
- TRACKING RADAR**
The intercept of covert radar A79-38132
- TRAILING EDGES**
Low-speed wind-tunnel investigation of wing fins as trailing-vortex-alleviation devices on a transport airplane model [NASA-TP-1453] N79-24961
- TRAINING SIMULATORS**
Contributions of platform motion to simulator training effectiveness. Study 2: Aerobatics [AD-A064305] N79-23985
Optimal placement of regional flight simulators [AD-A060450] N79-25043

TRANSFER OF TRAINING

TRANSFER OF TRAINING

Contributions of platform motion to simulator training effectiveness. Study 2: Aerobatics
[AD-A064305] N79-23985

TRANSIENT RESPONSE

The estimation of induced-voltage peak magnitude and energy level under LTA/EMP excitation of low-loss aircraft cabling --- Lightning Transit Analysis/Electro-Magnetic Pulse
A79-37238

Identification of voltage transients on aircraft cabling under LTA excitation --- Lightning Transient Analysis
A79-38531

Model study of transient processes in a hydraulic power amplifier
A79-38814

TRANSIT SATELLITES

The MX 1105, an integrated Transit/Omega navigator
A79-36072

TRANSIT TIME

The airport performance model. Volume 1: Extensions, validations, and applications
[AD-A062863] N79-25040

TRANSMISSIONS (MACHINE ELEMENTS)

Diagnostics of wear in aeronautical systems
A79-39805

Helicopter transmission vibration and noise reduction program. Volume 3: Evaluation of fiber FP metal-matrix housing specimens
[AD-A066794] N79-24983

TRANSONIC FLOW

Application of Laser Doppler Anemometry to aeroacoustic research
A79-39500

Numerical calculation of inviscid transonic flow through rotors and fans
N79-23906

A finite element method for the computation of the transonic potential flow past airfoils
[MBB-UFE-1352-0] N79-23935

Airfoil optimization for transonic flow using the methods of finite elements and characteristics
[MBB-UFE-1362-0] N79-23937

Theoretical analysis of transonic flow past unstaggered oscillating cascades
[AD-A063083] N79-24963

The computation of transonic flow in wind tunnels at inlets and cascades using the finite element method
[MBB-UFE-1421-0] N79-24970

TRANSONIC FLUTTER

Determination of subcritical frequency and damping from B-1 flight flutter test data
[NASA-CR-3152] N79-25426

TRANSONIC WIND TUNNELS

Some observations on the mechanism of aircraft wing rock
A79-38135

Model diffuser investigation for propulsion wind tunnel 16T
[AD-A065822] N79-23984

Some remarks on the design of transonic tunnels with low levels of flow unsteadiness
[NASA-CR-2722] N79-25039

TRANSPORT AIRCRAFT

The results of synthesizing and evaluating potential solutions for Multi-Function Inertial Reference Assembly /MIRA/ candidate configurations --- for transport and fighter aircraft
A79-36082

Bonding and durability --- for airframe structures
[SAE PAPER 790561] A79-36702

The evaluation of the weight of engine installations on transport aircraft
A79-37827

Westland unveils WG30 transport helicopter
A79-38092

Low-speed wind-tunnel investigation of wing fins as trailing-vortex-alleviation devices on a transport airplane model
[NASA-TP-1453] N79-24961

The influence of fleet variability on crack growth tracking procedures for transport/bomber aircraft
[AD-A066596] N79-25433

TRANSPORTATION

Cargo Logistics Airlift Systems Study (CLASS). Volume 2: Case study approach and results
[NASA-CR-158913] N79-24978

SUBJECT INDEX

TRAPEZOIDAL WINGS

Investigation of aerodynamic characteristics of subsonic wings
[NASA-CR-158661] N79-23921

TURBINE BLADES

Directionally solidified blades - Greater strength
A79-36248

A method of reducing aircraft turbine blade vibrations
A79-38819

Damage-tolerant fan blade design
[AIAA PAPER 79-1119] A79-38951

The application of rapid solidification rate superalloys to radial wafer turbine blades
[AIAA PAPER 79-1226] A79-38991

Advanced forging process for gas turbine engine fan blades
[AIAA PAPER 79-1269] A79-39013

Method of determining non-steady-state force characteristics and flywheel effect of turbine blades from the streamflow pattern
A79-39071

Internally coated air-cooled gas turbine blading
[NASA-CR-159574] N79-25018

TURBINE ENGINES

New opportunities for future small civil turbine engines - Overviewing the GATE studies
[SAE PAPER 790619] A79-36747

General aviation turbine engine /GATE/ concepts
[AIAA PAPER 79-1157] A79-38964

What small turbine engine does the small helicopter need, or The road to hell is paved with good intentions --- fuel consumption, performance, environmental and engine reliability and acceptability considerations subordinating advanced turbine engine development for small helicopters
[AIAA PAPER 79-1314] A79-39032

Application of electron-beam welding to aviation production --- tests of turbine engine parts welded by electron beam
N79-24940

Self stabilizing sonic inlet
[NASA-CASE-LEW-11890-1] N79-24976

Advanced General Aviation Turbine Engine (GATE) concepts
[NASA-CR-159603] N79-25017

Regression Simulation of turbine engine performance: Accuracy improvement (task 4)
[AD-A066398] N79-25027

TURBINE EXHAUST NOZZLES

Partially variable area turbine nozzle
[AIAA PAPER 79-1227] A79-38992

TURBINE WHEELS

Damage tolerant design - An approach to reducing the life cycle cost of gas turbine engine disks
[AIAA PAPER 79-1189] A79-38976

The strainrange partitioning behavior of an advanced gas turbine disk alloy, AP2-1DA
[AIAA PAPER 79-1192] A79-38977

TURBINES

Engine demonstration test of a cooled laminated axial turbine
[AIAA PAPER 79-1229] A79-38993

The monorotor gas turbine
[AIAA PAPER 79-1230] A79-38994

TURBOCOMPRESSORS

Allowing for the wall boundary layer in an axial compressor stage
A79-36586

Selection of aircraft turbocharger systems
[SAE PAPER 790608] A79-36739

Effects of air injection on a turbocharged Teledyne Continental Motors TS10-360-C engine
[SAE PAPER 790607] A79-36760

Combined pressure and temperature distortion effects on internal flow of a turbofan engine
[AIAA PAPER 79-1309] A79-39031

Two-stage supercharger sets: Efficiency and head distribution under full- and part-load conditions
[RTS-11613] N79-24342

TURBOFAN ENGINES

Manufacturers developing fuel-efficient engines
A79-36380

Design description of a four-place business jet using two WR-19 engines
[SAE PAPER 790580] A79-36715

Preliminary QCGAT program test results --- Quiet, Clean General Aviation Turbofan
[SAE PAPER 790596] A79-36729

Rolls-Royce RB.401-07 turbofan engine for business aircraft in the 1980's
[SAE PAPER 790620] A79-36748

Damage-tolerant fan blade design
[AIAA PAPER 79-1119] A79-38951

Propulsion system sensitivities for a strategic aircraft
[AIAA PAPER 79-1121] A79-38952

Turbo-fan design for general aviation - The evolution of the RB.401
[AIAA PAPER 79-1160] A79-38966

Test verification of a turbofan partial swirl afterburner
[AIAA PAPER 79-1199] A79-38981

The impact of operational requirements on V/STOL propulsion concept selection
[AIAA PAPER 79-1283] A79-39018

Multivariable control altitude demonstration on the F100 turbofan engine
[AIAA PAPER 79-1204] A79-39814

Predicted F100 engine response to circumferential pressure and temperature distortion
[AIAA PAPER 79-1310] A79-39819

Characteristics of the advanced supersonic technology AST-105-1 configured for transpacific range with Pratt and Whitney aircraft variable stream control engines
[NASA-TM-78818] N79-23888

Combined pressure and temperature distortion effects on internal flow of a turbofan engine
[NASA-TM-79136] N79-23963

Effect of steady-state pressure distortion on flow characteristics entering a turbofan engine
[NASA-TM-79134] N79-23969

Multivariable control altitude demonstration on the F100 turbofan engine
[NASA-TM-79183] N79-25015

Operating condition and geometry effects on low-frequency afterburner combustion instability in a turbofan at altitude
[NASA-TP-1475] N79-25022

TURBOFANS
Advanced forging process for gas turbine engine fan blades
[AIAA PAPER 79-1269] A79-39013

TURBOJET ENGINE CONTROL
Multivariable control altitude demonstration on the F100 turbofan engine
[AIAA PAPER 79-1204] A79-39814

TURBOJET ENGINES
The multiple application core engine - Sizing and usage criteria --- high-pressure rotors in jet engines
[AIAA PAPER 79-1123] A79-38953

Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface
[AIAA PAPER 79-1170] A79-38969

Effect of shocks on film cooling of a full scale turbojet exhaust nozzle having an external expansion surface
[NASA-TM-79157] N79-23966

TURBOMACHINERY
Radial equilibrium in axial turbomachines
A79-37828

The role of three-dimensional flow analysis in the design of turbomachinery
[AIAA PAPER 79-1231] A79-38995

Experimental analysis methods for unsteady flows in turbomachines
[ONERA, TP NO. 1979-59] A79-39095

TURBOPROP AIRCRAFT
Interference effects of aircraft components on the local blade angle of attack of a wing-mounted propeller
[NASA-TM-78587] N79-25021

TURBOPROP ENGINES
Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise
[SAE PAPER 790573] A79-36759

Tone noise of three supersonic helical tip speed propellers in a wind tunnel
A79-39801

TURBULENCE

Turbulence characteristics of compressor discharge flows --- JT9D engine tests
N79-24995

Turbulence measurements in the compressor exit flow of a General Electric CF6-50 engine
N79-24996

TURBULENT BOUNDARY LAYER
A method for the calculation of 3D boundary layers on practical wing configurations
A79-38906

TURBULENT DIFFUSION
Turbulence characteristics of compressor discharge flows --- JT9D engine tests
N79-24995

TURBULENT FLOW
Rotor blade stability in turbulent flows. I
A79-38118

Methodology for prediction of V/STOL propulsion induced forces in ground effect
[AIAA PAPER 79-1281] A79-39017

TURBULENT JETS
Noise characteristics of heated high velocity rectangular jets --- jet engine application
A79-38399

TURBULENT WAKES
Turbulent wake measurements with a laser velocimeter
[AIAA PAPER 79-1087] A79-38058

TWO DIMENSIONAL FLOW
Profiling of two-dimensional and three-dimensional nozzles and calculation of their flows
A79-38168

U**ULTRASONIC TESTS**

Broad-band ultrasonic transducers for non-destructive inspection of aeronautical components
[ONERA, TP NO. 1979-45] A79-39094

ULTRASONIC WAVE TRANSDUCERS
Broad-band ultrasonic transducers for non-destructive inspection of aeronautical components
[ONERA, TP NO. 1979-45] A79-39094

Broad-band transducers for nondestructive inspection of aeronautical components
N79-25419

UNSTEADY FLOW

The analysis of propellers including interaction effects --- for general aviation aircraft
[SAE PAPER 790576] A79-36712

Analysis of an unsteady aerodynamic force on a blade due to nonuniform amplitude gusts
A79-39059

Experimental analysis methods for unsteady flows in turbomachines
[ONERA, TP NO. 1979-59] A79-39095

Some remarks on the design of transonic tunnels with low levels of flow unsteadiness
[NASA-CR-2722] N79-25039

USER MANUALS (COMPUTER PROGRAMS)
Fuselage-mounted antenna code: User's manual
[AD-A065587] N79-24215

User's guide: Computer program with interactive graphics for analysis of plane frame structures (CFRAME)
[AD-A067349] N79-25428

V**V/STOL AIRCRAFT**

The British Aerospace Harrier: Case study in aircraft design --- Book
A79-36644

A unique facility for V/STOL aircraft hover testing
A79-37296

Investigation of a laser Doppler velocimeter system to measure the flow field of a large scale V/STOL aircraft in ground effect
[AIAA PAPER 79-1184] A79-38974

Methodology for prediction of V/STOL propulsion induced forces in ground effect
[AIAA PAPER 79-1281] A79-39017

The impact of operational requirements on V/STOL propulsion concept selection
[AIAA PAPER 79-1283] A79-39018

V/STOL aircraft configuration effects on exhaust gas ingestion [AIAA PAPER 79-1284] A79-39019
Theoretical fan velocity distortions due to inlets and nozzles --- in V/STOL aircraft [NASA-TM-79150] N79-23911

VALIDITY
Validation of aircraft noise prediction program [NASA-CR-159047] N79-25843

VAPORIZING
Lean, premixed, prevaporized combustion for aircraft gas turbine engines [NASA-TM-79148] N79-23964
Effect of degree of fuel vaporization upon emissions for a premixed prevaporized combustion system --- for gas turbine engines [NASA-TM-79154] N79-23965
Premixed Prevaporized Combustor Technology Forum [NASA-CR-2078] N79-24994

VARIABLE CYCLE ENGINES
Multivariable control altitude demonstration on the F100 turbofan engine [AIAA PAPER 79-1204] A79-39814
Regression Simulation of turbine engine performance: Accuracy improvement (task 4) [AD-A066398] N79-25027

VARIABLE GEOMETRY STRUCTURES
Partially variable area turbine nozzle [AIAA PAPER 79-1227] A79-38992

VARIABLE SWEEP WINGS
Aeroelastic stability analysis of the AD-1 manned oblique-wing aircraft A79-38136

VATOL AIRCRAFT
The impact of operational requirements on V/STOL propulsion concept selection [AIAA PAPER 79-1283] A79-39018

VECTOR ANALYSIS
A vector-continuous loading concept for aerodynamic panel methods [NASA-TM-80104] N79-24956

VELOCITY DISTRIBUTION
Theoretical fan velocity distortions due to inlets and nozzles --- in V/STOL aircraft [NASA-TM-79150] N79-23911
Interactional aerodynamics of the single rotor helicopter configuration. Volume 3B: Flow angle and velocity wake profiles in low frequency band, air ejector systems and other devices [AD-A061767] N79-24966

VELOCITY MEASUREMENT
Turbulent wake measurements with a laser velocimeter [AIAA PAPER 79-1087] A79-38058

VERTICAL AIR CURRENTS
A wind shear/downdraft drift angle warning system A79-38477

VERTICAL DISTRIBUTION
Vertical cutoff rigidity and the intensity distribution of cosmic rays near Cape Town A79-37468

VERTICAL LANDING
Evaluation of an FM/CW range measurement system for VTOL landing A79-36086

VERTICAL MOTION
Theoretical fundamentals of radio altimetry --- Russian book A79-38145

VERTICAL TAKEOFF AIRCRAFT
Evaluation of an FM/CW range measurement system for VTOL landing A79-36086
Technical evaluation report on the 27th Guidance and Control Panel Symposium on the V/STOL Aircraft at Night and in Poor Visibility [AGARD-AR-142] N79-23946

VIBRATION
Prediction of the angular response power spectral density of aircraft structures [AD-A066141] N79-23956
Helicopter transmission vibration and noise reduction program. Volume 3: Evaluation of fiber FP metal-matrix housing specimens [AD-A066794] N79-24983

VIBRATION DAMPING
Designing with damping materials to reduce noise and structural fatigue --- of aircraft components [SAE PAPER 790631] A79-36758

A method of reducing aircraft turbine blade vibrations A79-38819
Determination of subcritical frequency and damping from B-1 flight flutter test data [NASA-CR-3152] N79-25426

VIBRATION EFFECTS
Engine induced structural-borne noise in a general aviation aircraft [SAE PAPER 790626] A79-36754

VIBRATION MEASUREMENT
Model verification of force determination for measuring vibratory loads --- of rotors on helicopters A79-36379

VIBRATION TESTS
Model verification of force determination for measuring vibratory loads --- of rotors on helicopters A79-36379
Engine demonstration test of a cooled laminated axial turbine [AIAA PAPER 79-1229] A79-38993

VIBRATORY LOADS
Model verification of force determination for measuring vibratory loads --- of rotors on helicopters A79-36379

VOICE COMMUNICATION
Nap-of-the-earth communication program for US Army helicopters [AD-A063089] N79-24232

VORTEX BREAKDOWN
Investigation of aerodynamic characteristics of subsonic wings [NASA-CR-158661] N79-23921

VORTEX SHEETS
The 'cloud-in-cell' technique applied to the roll up of vortex sheets A79-37725

VORTICES
Practical design of minimum induced loss propellers [SAE PAPER 790585] A79-36720
Vortex-induced oscillations - A selective review A79-39751
Aircraft wake vortices. A bibliography with abstracts [NTIS/PS-79/0166/3] N79-23939
Low-speed wind-tunnel investigation of wing fins as trailing-vortex-alleviation devices on a transport airplane model [NASA-TP-1453] N79-24961

VULNERABILITY
NOVA-2S, a stiffened panel extension of the NOVA-2 computer program [AD-A066038] N79-23951

W

WAKES
Interactional aerodynamics of the single rotor helicopter configuration. Volume 3B: Flow angle and velocity wake profiles in low frequency band, air ejector systems and other devices [AD-A061767] N79-24966
Interactional aerodynamics of the single rotor helicopter configuration. Volume 6B: One-third octave band spectrograms of wake single film data, basic configuration wake explorations [AD-A061861] N79-24968

WALL FLOW
Allowing for the wall boundary layer in an axial compressor stage A79-36586

WALL JETS
Calculation of a laminar wall jet in a wake A79-36582

WANKEL ENGINES
A review of Curtiss-Wright rotary engine developments with respect to general aviation potential [SAE PAPER 790621] A79-36749

WARNING SYSTEMS
A wind shear/downdraft drift angle warning system A79-38477
Feasibility and cost effectiveness of airborne tire pressure indicating systems [AD-A065513] N79-24981

- WATER**
Water absorption of fluids/oils --- contamination of aircraft engine oils and inhibitors [AD-A065915] N79-24158
- WEAPON SYSTEMS**
Reliability and maintainability contribution to Hornet mission success A79-39915
- WEAR**
Diagnostics of wear in aeronautical systems [NASA-TM-79185] N79-24350
- WEAR TESTS**
Effects of extended oil changes on aircraft piston engine wear and oil characteristics [SAE PAPER 790629] A79-36756
Diagnostics of wear in aeronautical systems A79-39805
Aircraft engine oil analysis by neutron activation techniques [AD-A066202] N79-24169
- WEIGHT REDUCTION**
Industry seeks lighter aircraft weight --- aircraft design performance A79-36100
Composite applications at Bell Helicopter [SAE PAPER 790578] A79-36713
Impact of advanced technologies on aircraft design A79-37045
Propulsion system sensitivities for a strategic aircraft [AIAA PAPER 79-1121] A79-38952
Aircraft engine nozzle [NASA-CASE-ARC-10977-1] N79-23971
A variational theorem for laminated composite plates of nonlinear materials and applications to postbuckling N79-24977
- WELD TESTS**
Application of electron-beam welding to aviation production --- tests of turbine engine parts welded by electron beam N79-24940
- WELDED JOINTS**
Application of electron-beam welding to aviation production --- tests of turbine engine parts welded by electron beam N79-24940
- WESTLAND AIRCRAFT**
Westland unveils WG30 transport helicopter A79-38092
- WHEEL BRAKES**
Model study of aircraft disk brakes A79-38816
- WIND SHEAR**
The effects of low-level wind shear on the approach and go-around performance of a landing jet aircraft [SAE PAPER 790568] A79-36708
A wind shear/downdraft drift angle warning system A79-38477
- WIND TUNNEL MODELS**
Aeroelastic models for cryogenic wind tunnels [ONERA, TP NO. 1979-39] A79-39088
- WIND TUNNEL TESTS**
Full-scale wind-tunnel investigation of an Ayres S2R-800 Thrush Agricultural Airplane [SAE PAPER 790618] A79-36746
Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise [SAE PAPER 790573] A79-36759
Control considerations for CCV fighters at high angles of attack A79-37295
Experimental data on the dynamic properties of several propeller vanes --- turbulence measurement in wind tunnel A79-38943
Evaluation of an ejector-powered engine simulator at transonic Mach numbers [AIAA PAPER 79-1165] A79-38967
A parametric study of support system interference effects on nozzle/afterbody throttle dependent drag in wind tunnel testing [AIAA PAPER 79-1168] A79-38968
V/STOL aircraft configuration effects on exhaust gas ingestion [AIAA PAPER 79-1284] A79-39019
- Tone noise of three supersonic helical tip speed propellers in a wind tunnel A79-39801
Introduction to the arcopter arc wing and the Bertelsen effect for positive pitch stability and control N79-23895
An investigation of a full-scale rotor with four blade tip planform shapes --- in Ames Research Center 40 by 80 Foot Wind Tunnel [NASA-TM-78580] N79-23922
Low-speed wind-tunnel investigation of wing fins as trailing-vortex-alleviation devices on a transport airplane model [NASA-TP-1453] N79-24961
The computation of transonic flow in wind tunnels at inlets and cascades using the finite element method [NBB-UFE-1421-0] N79-24970
Tone noise of three supersonic helical tip speed propellers in a wind tunnel [NASA-TM-79167] N79-25840
An experimental investigation of the effect of rotor tip shape on helicopter blade-slap noise --- in the Langley V/STOL wind tunnel [NASA-TM-80066] N79-25844
- WIND TUNNELS**
Making fluid flows visible A79-36373
An introduction to dynamic derivatives. 2: The equations of motion for wind tunnel pitch-yaw oscillation rigs [ARL-AERO-NOTE-377] N79-23982
- WIND VANES**
Experimental data on the dynamic properties of several propeller vanes --- turbulence measurement in wind tunnel A79-38943
- WIND VELOCITY MEASUREMENT**
Experimental data on the dynamic properties of several propeller vanes --- turbulence measurement in wind tunnel A79-38943
- WING FLAPS**
The 'cloud-in-cell' technique applied to the roll up of vortex sheets A79-37725
- WING LOADING**
The 'cloud-in-cell' technique applied to the roll up of vortex sheets A79-37725
- WING NACELLE CONFIGURATIONS**
Interference effects of aircraft components on the local blade angle of attack of a wing-mounted propeller [NASA-TM-78587] N79-25021
Assessment at full scale of nozzle/wing geometry effects on OTW aero-acoustic characteristics --- short takeoff aircraft noise [NASA-TM-79168] N79-25841
- WING OSCILLATIONS**
Some observations on the mechanism of aircraft wing rock A79-38135
Aeroelastic stability analysis of the AD-1 manned oblique-wing aircraft A79-38136
- WING PANELS**
A vector-continuous loading concept for aerodynamic panel methods [NASA-TM-80104] N79-24956
- WING PLANFORMS**
Minimization theory of induced drag subject to constraint conditions [NASA-CR-3140] N79-23923
- WING PROFILES**
Wing shape optimization for maximum cross-country speed, with mathematical programming N79-23899
An annular wing [NASA-CASE-PRC-11007-2] N79-24959
- WING SPAN**
Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927

WING TIPS**SUBJECT INDEX****WING TIPS**

A parametric study of support system interference
effects on nozzle/afterbody throttle dependent
drag in wind tunnel testing
[AIAA PAPER 79-1168] A79-38968

WINGLETS

The Learjet 'Longhorn' series - The first jets
with winglets
[SAE PAPER 790581] A79-36716

WINGS

Effect of forward acceleration on aerodynamic
characteristics of wings A79-38124

A method for the calculation of 3D boundary layers
on practical wing configurations A79-38906

Assessment at full scale of nozzle/wing geometry
effects on OTW aeroacoustic characteristics ---
over The Wing STOL engine configurations A79-39802

The effect of disturbance on a wing N79-23893

Introduction to the arcopter arc wing and the
Bertelsen effect for positive pitch stability
and control N79-23895

Numerical optimization techniques for bound
circulation distribution for minimum induced
drag of nonplanar wings: Basic formulations
[NASA-CR-3154] N79-23924

Low-speed wind-tunnel investigation of wing fins
as trailing-vortex-alleviation devices on a
transport airplane model N79-24961

WORKLOADS (PSYCHOPHYSIOLOGY)

The time budget as a criterion for the workload of
air traffic controllers N79-23943

X**X RAY STRESS MEASUREMENT**

X-ray determination of internal stress states due
to surface treatment of TiAl6V4 and TiAl6V6Sn2
A79-36003

Y**YAW**

An introduction to dynamic derivatives. 2: The
equations of motion for wind tunnel pitch-yaw
oscillation rigs N79-23982

YF-16 AIRCRAFT

Factors influencing the accuracy of aerodynamic
hinge-moment prediction N79-24965

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl 113)*

SEPTEMBER 1979

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g. NASA report translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g. N79 11001. Under any one author's name the accession numbers are arranged in sequence with the /AA accession numbers appearing first.

A

- ABRAMOVICH, K. G.**
Forecasting the quantitative characteristics of aircraft icing
[BLL-TRANS-1364-(9022.549)] N79-24971
- ACURIO, J.**
Materials and structural aspects of advanced gas-turbine helicopter engines A79-39804
- ADAMS, R. I.**
Overview of helicopter ice protection system developments N79-23919
- ARENS, D. J.**
Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics [SAE PAPER 790589] A79-36723
- AKSENOV, Y. P.**
Theory of thin wing in a supersonic flow with consideration of the non-equilibrium state of excitation of oscillating degrees of freedom [AD-A065992] N79-23928
- ALFARO-BOU, E.**
NASA general aviation crashworthiness seat development [SAE PAPER 790591] A79-36725
- ALIC, J. A.**
Fretting fatigue, with reference to aircraft structures [SAE PAPER 790612] A79-36741
- ALJABRI, A. S.**
The analysis of propellers including interaction effects [SAE PAPER 790576] A79-36712
- ANDERSEN, R. H.**
Partially variable area turbine nozzle [AIAA PAPER 79-1227] A79-38992
- ANDERSON, R. E.**
A variational theorem for laminated composite plates of nonlinear materials and applications to postbuckling N79-24977
- ANDO, S.**
Effect of forward acceleration on aerodynamic characteristics of wings A79-38124
- ANDRISANI, D., II**
Active control for the Total-In-Flight simulator (ACTIPS) [NASA-CR-3118] N79-23978

- ARAI, H.**
Transient ablation of Teflon in intense radiative and convective environments A79-38123
- ARIARATHAN, S. T.**
Rotor blade stability in turbulent flows. I A79-38118
- ARMBRUSTER, M.**
Dry friction in the aerospace industry A79-39873
- ARMSTRONG, T. J.**
Crashworthiness analysis of field investigation of business aircraft accidents [SAE PAPER 790587] A79-36721
- ARONSTAM, G. A.**
The selection of materials technologies for full-scale development [AIAA PAPER 79-1152] A79-38962
- ARORA, J. S.**
Substructuring methods for design sensitivity analysis and structural optimization [AD-A065935] N79-23949
- ARVIN, J. E.**
Fail-safe optimal design of structures with substructuring [AD-A065936] N79-23950
- ARVIN, J. E.**
Dynamic structural analysis with substructures [AD-A065937] N79-24378
- ASCHER, H.**
Development of a gas turbine combustor dilution zone design analysis [AIAA PAPER 79-1194] A79-38979
- ASCHER, H.**
The aircraft air conditioner data revisited A79-39895

B

- BABER, H. T., JR.**
Characteristics of the advanced supersonic technology AST-105-1 configured for transpacific range with Pratt and Whitney aircraft variable stream control engines [NASA-TN-78818] N79-23888
- BAKER, G. R.**
The 'cloud-in-cell' technique applied to the roll up of vortex sheets A79-37725
- BAKER, R. E.**
Brittle materials design, high temperature gas turbine: Ceramic turbine rotor technology [AD-A067176] N79-25029
- BALABAN, H.**
The F-16 RIW program A79-39889
- BARANOVSKY, S.**
Ignition of liquid fuel jets in a supersonic air stream [AIAA PAPER 79-1238] A79-38997
- BARTLETT, P. D., JR.**
Model verification of force determination for measuring vibratory loads A79-36379
- BATEMAN, R. P.**
Multifunction keyboard implementation study [AD-A066140] N79-25046
- BAZIN, M.**
Balance and sting design for cryogenic wind tunnels [ONERA, TP NO. 1979-40] A79-39089
- BEASLEY, W. D.**
Low-speed wind tunnel results for a modified 13-percent-thick airfoil [NASA-TN-X-74018] N79-24960

- BECKER, E. E.**
Exhaust emissions characteristics for a general aviation light-aircraft Avco Lycoming 10-360-A1B6D piston engine [AD-A066556] N79-25544
Exhaust emissions characteristics for a general aviation light-aircraft Avco-Lycoming 10-360-BiBD piston engine [AD-A066589] N79-25545
- BEGGS, E. B.**
Avionics technology for tactical data handling N79-25979
- BEHEIN, M. A.**
Executive summary of Aircraft Icing Specialists Workshop N79-23914
- BELLANTONI, J.**
The airport performance model. Volume 1: Extensions, validations, and applications [AD-A062863] N79-25040
- BENTLEY, R.**
Evaluation of ground-launch firings for the improved 2.75-inch rocket [AIAA PAPER 79-1297] A79-39027
- BERESTNEVA, N. S.**
Allowing for the wall boundary layer in an axial compressor stage A79-36586
- BERGDAUER, D. H.**
Evaluation of ground-launch firings for the improved 2.75-inch rocket [AIAA PAPER 79-1297] A79-39027
- BERGEY, K. H.**
New technologies for general aviation aircraft [SAE PAPER 790613] A79-36742
- BERGMAN, R. W.**
Evaluation of ground-launch firings for the improved 2.75-inch rocket [AIAA PAPER 79-1297] A79-39027
- BERKSTRESSER, B. K.**
A Demonstration Advanced Avionics System for general aviation [SAE PAPER 790569] A79-36709
- BERRY, F. C., JR.**
F-18 - A special report A79-38131
- BERTENSEN, W. D.**
Introduction to the arcopter arc wing and the Bertelsen effect for positive pitch stability and control N79-23895
- BEZAT, A. G.**
The effect of endless burn-in on reliability growth projections A79-39920
- BILL, F. A.**
Driveshaft alignment indicator [AD-A065988] N79-23973
- BINGHAM, G. J.**
Helicopter rotor airfoil [NASA-CASE-LAR-12396-1] N79-24958
- BINGHAM, L. W., JR.**
A new light twin using bonded metal construction [SAE PAPER 790603] A79-36735
- BIRD, D. K.**
Electromechanical actuation for business aircraft [SAE PAPER 790622] A79-36750
- BLACK, G. T.**
Proceedings of AFDPDL Flying Qualities Symposium [AD-A066493] N79-24982
- BLACKWELL, R. H.**
Aeroelastically conformable rotor mission analysis [AD-A067338] N79-24985
- BLANA, B. J.**
Wind tunnel performance of four energy efficient propellers designed for Mach 0.8 cruise [SAE PAPER 790573] A79-36759
Tone noise of three supersonic helical tip speed propellers in a wind tunnel A79-39801
Aircraft icing [NASA-CP-2086] N79-23912
Tone noise of three supersonic helical tip speed propellers in a wind tunnel [NASA-TM-79167] N79-25840
- BLOEDEL, A. W.**
Experimental verification of program KRASH - A mathematical model for general aviation structural crash dynamics [SAE PAPER 790589] A79-36723
- BOBULA, G. A.**
Effects of steady-state pressure distortion on the stall margin of a J85-21 turbojet engine [NASA-TM-79123] N79-23968
Effect of steady-state pressure distortion on flow characteristics entering a turbofan engine [NASA-TM-79134] N79-23969
- BOGATKO, V. I.**
Second approximation in theory of a finite-span thin wing in a hypersonic gas flow A79-35927
- BORGMEYER, C. H.**
A streamlined control system development process [AIAA PAPER 79-1344] A79-39048

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl 113)*

SEPTEMBER 1979

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to ten special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

Carnegie Library of Pittsburgh

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

OKLAHOMA

Oklahoma County Libraries, Oklahoma City

TENNESSEE

Memphis Public Library

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "*" and "#", from ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av. Charles de Gaulle, 92-Neuilly-sur-Seine, France.
